## THEORETICAL EXAM

# $\mathbf{I}^{\top} \mathbf{c}^{\top} \mathbf{h} \mathbf{0}$ <br> 51st-International Chemistry Olympiad France - Paris - 2019 

Making science together!
2019-07-26

## Candidate: GBR-1

## General instructions

- This theoretical exam booklet contains 64 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective boxes on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scrap paper, use the back of the exam sheets. Remember that nothing outside the boxes will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), raise the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30 -minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by $1 / 2$ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

## GOOD LUCK!

## Candidate: GBR-1

## Table of Contents

This theoretical exam is composed of nine independent problems, as follows. Their relative weight is indicated in brackets.

| Problem T1: Infinite well and butadiene | $(6 \%)$ | p. 8 |
| :--- | :--- | :--- |
| Problem T2: Hydrogen production by water-splitting | $(7 \%)$ | p. 13 |
| Problem T3: About silver chloride | $(5 \%)$ | p. 20 |
| Problem T4: From gunpowder to the discovery of iodine | $(7 \%)$ | p. 25 |
| Problem T5: Complexes for the formation of nanomachines | $(8 \%)$ | p. 31 |
| Problem T6: Characterisation of a block-copolymer | $(8 \%)$ | p. 41 |
| Problem T7: Ring motion in a [2]catenane | $(6 \%)$ | p. 49 |
| Problem T8: Identification and synthesis of inositols | $(6 \%)$ | p. 54 |
| Problem T9: Synthesis of levobupivacaine | $(7 \%)$ | p. 60 |

## Candidate: GBR-1

## Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in $\mathrm{mol} \mathrm{L}^{-1}$. To further simplify formulas and expressions, the standard concentration $c^{\circ}=1 \mathrm{~mol} \mathrm{~L}^{-1}$ is omitted.

## Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written as $\mathrm{CH}_{2}=\mathrm{CH}-\mathrm{CH}=\mathrm{CH}_{2}$, with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the $\pi$ electrons are better described by a distribution along the three bonds:

This system can be modelled as a 1D box (i.e. an infinite well) where the electrons are free. The energy of an electron in an infinite well of length $L$ is: $E_{n}=\frac{n^{2} h^{2}}{8 m_{e} L^{2}}$, where $n$ is a non-zero positive integer.

1. Two different models are studied. Sketch at least the three lowest energy levels, $E_{\mathrm{n}}$, $\underline{\mathbf{f o r}}$ each model on the respective diagrams, showing how the relative energy levels differ within and between models.

Model 1 («localised»): The $\pi$ electrons are localised on the outer bonds and exist in two separate infinite potential wells of length $d$.

Model 2 («delocalised»): The $\pi$ electrons are delocalised across the whole molecule and exist in a single infinite potential well of length $3 d$.

## Candidate: GBR-1

2. Place the $\pi$ electrons for model 1 in the diagram and express the total energy of the $\pi$ system in model 1 , as a function of $h, m_{\mathrm{e}}$ and $d$.
$\square$
3. Place the $\pi$ electrons for model 2 in the diagram and express the total energy of the $\pi$ system in model 2, as a function of $h, m_{\mathrm{e}}$ and $d$.
$\square$
The conjugation energy is the total energy of the actual $\pi$ system, minus the sum of the energies of ethylene molecules involving the same number of electrons.
4. Express the conjugation energy, $\Delta E_{\mathrm{c}}$, of butadiene, as a function of $h, m_{\mathrm{e}}$ and $d$.

$$
\Delta E_{\mathrm{c}}=
$$

Models 1 and 2 are too simplistic. A new model is described here.
5. Draw three other resonance structures of butadiene using Lewis notation.

|  |  |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{H}_{2} \mathrm{C}^{\wedge}=\mathrm{CH}_{2}$ |  |  |  |

To take into account the size of carbon atoms, model 2 is now modified into model 3, as follows:

- the new length of the well is $L$ and is located between 0 and $L$;
- the carbon atoms are located at $L / 8 ; 3 L / 8 ; 5 L / 8$ and $7 L / 8$.

For each level $n$, the $\pi$ wavefunction is:

$$
\psi_{\mathrm{n}}(x)=\sqrt{\frac{2}{L}} \sin \left(\frac{n \pi x}{L}\right)
$$

and the $\pi$ electron density for a system with $N \pi$ electrons is:

$$
\rho(x)=2 \sum_{i=1}^{N / 2}\left|\psi_{i}(x)\right|^{2}
$$

## Candidate: GBR-1

The four $\pi$ wavefunctions, which correspond to the molecular orbitals of the $\pi$ system, are shown below (in random order).

6. Order the energies of the four $\pi$ wavefunctions $\left(E_{\mathrm{A}}, E_{\mathrm{B}}, E_{\mathrm{C}}\right.$ and $\left.E_{\mathrm{D}}\right)$.
$\square \lll<$
7. Give the labels (A, B, C or D) of the orbitals that are filled with electrons in butadiene.
$\square$
8. Using model 3 , give the values of the $\pi$ wavefunctions $\psi_{\mathrm{n}}$ for occupied levels at positions $0, L / 4$ and $L / 2$, for $n=1$ and $n=2$, as a function of $L$.
$\psi_{1}(0)=$
$\psi_{1}\left(\frac{L}{4}\right)=$
$\psi_{1}\left(\frac{L}{2}\right)=$
$\psi_{2}(0)=$
$\psi_{2}\left(\frac{L}{4}\right)=$
$\psi_{2}\left(\frac{L}{2}\right)=$

## Candidate: GBR-1

9. Using model 3, give the value of the $\pi$ electron density at each of the positions $0, L / 4$ and L/2.
$\rho(0)=$
$\rho\left(\frac{L}{4}\right)=$
$\rho\left(\frac{L}{2}\right)=$
10. Draw the $\pi$ electron density between 0 and $L$.

11. $\underline{\text { Order }}$ the following CC bonds $(\mathrm{B} 1, \mathrm{~B} 2, \ldots, \mathrm{~B} 5)$ by increasing length, using the symbols $=$ or $<$ :
B1: $\quad \mathrm{C} 1 \mathrm{C} 2$ in the butadiene molecule
$\mathrm{B} 2: \quad \mathrm{C} 2 \mathrm{C} 3$ in the butadiene molecule
B3: $\quad \mathrm{C} 3 \mathrm{C} 4$ in the butadiene molecule
B4: $\quad \mathrm{CC}$ in the ethane molecule
B5: $\quad$ CC in the ethene molecule

## Problem T2: Hydrogen production by water-splitting

## Data:

| Compound | $\mathrm{H}_{2}(\mathrm{~g})$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | $\mathrm{O}_{2}(\mathrm{~g})$ |
| :--- | :---: | :---: | :---: | :---: |
| $\Delta_{\mathrm{f}} H^{\circ}\left(\mathrm{kJ} \mathrm{mol}^{-1}\right)$ | 0 | -285.8 | -241.8 | 0 |
| $S_{\mathrm{m}}{ }^{\circ}\left(\mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)$ | 130.6 | 69.9 | 188.7 | 205.2 |

Molecular hydrogen $\left(\mathrm{H}_{2}\right)$ can be used as an alternative to carbon dioxide-emitting fuels. Lowering the cost and the environmental impact of its production is a major challenge. Watersplitting is a promising technology in this field.

1. Write the balanced equation of the splitting reaction of liquid water using a stoichiometric coefficient of 1 for water.
2. Using only the provided thermodynamic data, justify numerically whether this reaction is thermodynamically favorable at 298 K .
Calculations:

Reaction thermodynamically favorable?

$\square$ No

## Candidate: GBR-1

Acidified water can be split electrochemically (Fig. 1). Gas bubbles are formed at both electrodes.

Fig. 1 - Water-splitting electrochemical cell.
3. Write the balanced half equation for the reaction occurring at each electrode.

On electrode (1):
On electrode (2):
4. Using only the provided thermodynamic data (or your answer to question 2), derive the condition on the applied voltage between electrodes, $\Delta E_{\text {applied }}$ compared to a value $\Delta E_{\text {th }}$ (to be calculated), for the process to be thermodynamically favorable at 298 K when all reactants and products are in their standard state. Tick the correct condition and calculate the numerical value of $\Delta E_{\text {th }}$ to 3 decimal places.

Calculation:

ㅁ $\quad \Delta E_{\text {applied }}=\Delta E_{\text {th }}$
$\square \Delta E_{\text {applied }}>\Delta E_{\text {th }}$
$\Delta E_{\mathrm{th}}=\ldots \ldots \ldots . \mathrm{V}($ to 3 decimal places $)$
口 $\Delta E_{\text {applied }}<\Delta E_{\text {th }}$
If you could not calculate $\Delta E_{\mathrm{th}}$, the value 1.200 V can be used in the rest of the problem.

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting, $\Delta E_{\min }$, depends on the nature of the anode, as displayed in the table below:

| Anode | $\Delta E_{\min }(\mathrm{V})$ |
| :---: | :---: |
| $\mathrm{IrO}_{x}$ | 1.6 |
| $\mathrm{NiO}_{x}$ | 1.7 |
| $\mathrm{CoO}_{x}$ | 1.7 |
| $\mathrm{Fe}_{2} \mathrm{O}_{3}$ | 1.9 |

## Candidate: GBR-1

The difference between $\Delta E_{\min }$ and $\Delta E_{\mathrm{th}}$ is responsible for losses in the device.
5. State the expression of the device power efficiency $\eta_{\text {elec }}$ (the fraction of the power used for water splitting) as a function of $\Delta E_{\mathrm{th}}$ and $\Delta E_{\text {min }}$. Assuming an identical current value, $I$, calculate the water electrolysis power efficiency when a Pt cathode and a $\mathrm{Fe}_{2} \mathrm{O}_{3}$ anode are used. State the most efficient anode.
$\eta_{\text {elec }}=$

Power efficiency when Pt and $\mathrm{Fe}_{2} \mathrm{O}_{3}$ electrodes are used:
$\eta_{\text {elec }}=\quad \%$
Most efficient anode:
If you could not calculate $\eta_{\text {elec }}$, the value $\eta_{\text {elec }}=75 \%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

Fig. 2 - Activation condition and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard Hydrogen Electrode

Fig. 3 - Left axis: Spectral distribution of the solar photon flux $\phi$. The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with smaller wavelength).
6. Estimate the fraction of the solar photon flux that can activate the following semiconductors: $\mathrm{TiO}_{2}, \mathrm{CdS}, \mathrm{Si}$. State explicitly the equations and units used for the calculation.

## Candidate: GBR-1

The activation of the semi-conductor results in a modification of the surface potentials, so that it can be seen as two electrodes at different potentials.
7. Using the data in Fig 2, choose the semiconductor(s) in the following list that, once activated, can play the roles of both anode and cathode for the water-splitting reaction.

| $\square \mathrm{ZrO}_{2}$ | $\square \mathrm{ZnO}$ | $\square \mathrm{TiO}_{2}$ | $\square \mathrm{WO}_{3}$ |
| :--- | :--- | :--- | :--- |
| $\square \mathrm{CdS}$ | $\square \mathrm{Fe}_{2} \mathrm{O}_{3}$ | $\square \mathrm{CdSe}$ | $\square \mathrm{Si}$ |

8. State the semiconductor that, used as both cathode and anode, is expected to be the most efficient for water splitting upon a given amount of sunlight.

The evolution of $\mathrm{H}_{2}$ and $\mathrm{O}_{2}$ when a semiconductor is irradiated by simulated solar light at $T=25^{\circ} \mathrm{C}$ at $p_{\text {atm }}$ was recently studied. Using an incident power light of $P=1.0 \mathrm{~kW} \mathrm{~m}^{-2}$ and a photoelectrode with a $S=16 \mathrm{~mm}^{2}$ surface, the production of $V=0.37 \mathrm{~cm}^{3}$ of $\mathrm{H}_{2}(\mathrm{~g})$ was measured after $\Delta t=1$ hour of reaction.
9. Calculate the power efficiency $\eta_{\text {direct }}$ of the conversion.
$\square$

## Candidate: GBR-1

Two methods of converting solar energy to hydrogen can be compared: direct photocatalysis, and indirect photo-electrolysis combining a photovoltaic panel with an electrolyser. The efficiency of photovoltaic panels on the market is around $\eta_{\text {panels }}=20 \%$.
10. Compare the power efficiencies of the two methods, $\eta_{\text {direct }}$ and $\eta_{\text {indirect }}$, using $\mathrm{Fe}_{2} \mathrm{O}_{3}$ and Pt electrodes for the electrolysis.
Calculation:
$\eta_{\text {direct }}<\eta_{\text {indirect }}$

## Problem T3: About silver chloride

## Data at 298 K:

$\mathrm{p} K_{\mathrm{sl}}(\mathrm{AgCl})=9.7 ; \mathrm{p} K_{\mathrm{s} 2}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=12$
Formation constant of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}: \beta_{\mathrm{n}}=10^{7.2}$
Potentials relative to the standard hydrogen electrode:
Standard potential of $\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s}): E^{\circ}\left(\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s})\right)=0.80 \mathrm{~V}$
Observed potential of $\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{HO}^{-}(\mathrm{aq})$ (in seawater): $E^{\prime}\left(\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{HO}^{-}(\mathrm{aq})\right)=0.75 \mathrm{~V}$

## Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist, 1778-1850) deal with some properties of silver chloride.

Quote A: "I will now talk about silver chloride, a milky-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."
Quote B: "This salt has no taste since it is insoluble."
Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."
Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."
Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."
Quote F: "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milky-white solid."

1. Quote A: Write the balanced equation for the synthesis of $\mathrm{AgCl}(\mathrm{s})$.
$\square$
2. Quote B: Calculate the solubility, $s$, of $\mathrm{AgCl}(\mathrm{s})$ in water in $\mathrm{mol} \mathrm{L}^{-1}$ at 298 K .
$\square$

## Candidate: GBR-1

3. Quote C: In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry $1: 2$ is formed. On the following qualitative axis (with pCl increasing from left to right), place in each space the silver-containing species that is predominant (or exists, for solids). pCl values at boundaries are not expected.

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry $n$ is formed.
4. Write the balanced equation corresponding to the synthesis of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}$ from silver chloride and calculate the corresponding equilibrium constant.

Equation:

Calculation:

$$
K=
$$

If you could not calculate $K$, the following value can be used in the rest of the problem: $K=10^{-3}$
5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last bit of solid disappears. At this moment, $\left[\mathrm{NH}_{3}\right]=1.78 \mathrm{~mol} \mathrm{~L}^{-1}$. Determine the stoichiometry of the complex ignoring dilution effects.

```
Calculation:
n=
```

## Candidate: GBR-1

6. Write the balanced equation corresponding to quote $\mathbf{E}$.
$\square$
7. Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions, write a balanced equation corresponding to the formation of the solid mentioned in quote F. Calculate its equilibrium constant at 298 K . Use a stoichiometric coefficient of 1 for dioxygen when writing the balanced equation.

Equation:

Calculation:

$$
K=
$$

## Part B: The Mohr method

The Mohr method is based on the colorimetric titration of $\mathrm{Cl}^{-}$by $\mathrm{Ag}^{+}$in the presence of potassium chromate $\left(2 \mathrm{~K}^{+}, \mathrm{CrO}_{4}{ }^{2-}\right)$. Three drops ( $\sim 0.5 \mathrm{~mL}$ ) of a $\mathrm{K}_{2} \mathrm{CrO}_{4}$ solution at about $7.76 \times 10^{-3} \mathrm{~mol} \mathrm{~L}^{-1}$ are added to $\mathrm{V}_{0}=20.00 \mathrm{~mL}$ of a sodium chloride solution of unknown concentration $C_{\mathrm{Cl}}$. This solution is then titrated with silver nitrate $\left(\mathrm{Ag}^{+}, \mathrm{NO}_{3}{ }^{-}\right)$at $C_{\mathrm{Ag}}=0.050 \mathrm{~mol} \mathrm{~L}^{-1}$, which immediately leads to the formation of solid $\mathbf{A}$. A red precipitate (solid B) appears at $V_{\mathrm{Ag}}=4.30 \mathrm{~mL}$.

## Candidate: GBR-1

8. Write the balanced equations of the two reactions occurring during the experiment. Calculate the corresponding equilibrium constants.
$\square$
9. Identify the solids.

Solid A:
Solid B:
10. Calculate the unknown concentration, $C_{\mathrm{Cl}}$, of chloride ions in the sodium chloride solution.

11. Calculate the minimum volume, $V_{\mathrm{Ag}}(\mathrm{min})$, for which $\mathrm{AgCl}(\mathrm{s})$ precipitates.

| Calculation: |
| :---: |
|  |
|  |

## Problem T4: From gunpowder to the discovery of iodine

In the $19^{\text {th }}$ century, the French entrepreneur B. Courtois specialised in the production of nitrate $\mathbf{A}\left(\mathbf{M}_{\mathbf{A}}\left(\mathrm{NO}_{3}\right)_{m}\right)$, used for gunpowder. Initially imported from Asia, $\mathbf{A}$ was later produced from nitrate $\mathbf{B}\left(\mathbf{M}_{\mathbf{B}}\left(\mathrm{NO}_{3}\right)_{n}\right)$ using an exchange reaction with compound $\mathbf{C}$, obtained from algae.

1. Find the formulae of nitrates $\mathbf{A}$ and $\mathbf{B}$ knowing that they are anhydrous salts of alkaline or alkaline-earth metals ( $\mathbf{M}_{\mathbf{A}}$ and $\mathbf{M}_{\mathbf{B}}$ ). One of the nitrates contains no more than $1 \mathrm{w} \%$ of nonmetallic impurities while the other contains $9 \pm 3 \mathrm{w} \%$ of impurities. The content of metals $\mathbf{M}_{\mathbf{A}}$ and $\mathbf{M}_{\mathbf{B}}$ in the samples is $38.4 \mathrm{w} \%$ and $22.4 \mathrm{w} \%$ respectively. Support your answer with calculations.

To obtain $\mathbf{A}, 262.2 \mathrm{~g}$ of solid compound $\mathbf{C}$ was added to the solution containing 442.8 g of $\mathbf{B}$. $\mathbf{B}$ is in excess. 190.0 g of white precipitate $\mathbf{D}$ was formed and removed by filtration. The filtrate was evaporated, and the solid mixture $\mathbf{E}$ that was obtained was heated until the mass of the sample (containing only nitrites, $\mathrm{NO}_{2}^{-}$) was constant. The only gaseous product was dioxygen (here considered to be an ideal gas): 60.48 L at $0^{\circ} \mathrm{C}$ at 1 atm .
2. Calculate the composition (in w\%) of mixture $\mathbf{E}$ assuming that it contained only compounds $\mathbf{A}$ and $\mathbf{B}$ and no other impurities, and that $\mathbf{C}$ was anhydrous.
3. Determine the formulae of compounds $\mathbf{C}$ and $\mathbf{D}$ and write the equation for the reaction between $\mathbf{B}$ and $\mathbf{C}$.

C:
and $\mathbf{D}$ :

Reaction between $\mathbf{B}$ and $\mathbf{C}$ :

## Candidate: GBR-1

In 1811, when working with the ashes of algae, Courtois observed that copper vessels were worn out faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled a solution of concentrated sulfuric acid onto dry algae ashes: violet vapour instantly came out of the vessel ( $\mathbf{1}$, sulfuric acid is the oxidising agent): iodine ( $\mathrm{I}_{2}$ ) had just been discovered! Iodine was the cause of the copper corrosion (2). Due to the medicinal applications of iodine, Courtois opened a new manufacturing plant to produce it by the reaction of algae with chlorine (3).
Today, iodine is prepared from the set of reactants $\left(\mathrm{NO}_{3}^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}\right)(4)$, or $\left(\mathrm{IO}_{3}{ }^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}\right)(\mathbf{5})$.
4. Write equations for reactions $\mathbf{1 - 5}$.

| 1 |  |
| :--- | :--- |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |

The solubility of iodine is very low in water but significantly increases when iodide ions are added. Together they form ions such as triiodide, $\mathrm{I}_{3}{ }^{-}$:

$$
\begin{equation*}
\mathrm{I}^{-}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightleftharpoons \mathrm{I}_{3}^{-}(\mathrm{aq}) \tag{6}
\end{equation*}
$$

Equilibrium (6) can be studied by the extraction of $\mathrm{I}_{2}$ with dichloromethane. $\mathrm{I}^{-}$and $\mathrm{I}_{3}{ }^{-}$do not dissolve in organic solvents but $\mathrm{I}_{2}$ does and, when extracted, it is 15 times more concentrated in dichloromethane than in water.
The following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide ( 0.1112 g ). 50.0 mL of dichloromethane was then added, and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated the standard aqueous solution of sodium thiosulphate pentahydrate ( 14.9080 g in 1.000 L of solution) in the presence of starch. 16.20 mL was required for the organic phase and 8.00 mL for the aqueous phase. The process is schematically represented below:

## Problem T5: Azobenzene - $\beta$-cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of an energy source into nano-movement for applications such as drug delivery. Numerous nanomachines make use of the isomerisation of azo compounds ( $\mathrm{R}-\mathrm{N}=\mathrm{N}-\mathrm{R}$ ') upon irradiation.

1. Draw the stereoisomers of azobenzene $\left(\mathrm{H}_{5} \mathrm{C}_{6}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{5}\right)$ and draw a line between the two carbon atoms furthest apart in each compound. Compare the two distances ( $d_{\text {trans }}$ and $d_{\text {cis }}$ ).
$\square$

M

Fig. 1 - Possible reactants for the synthesis of $\boldsymbol{M}$.

## Candidate: GBR-1

2. $\mathbf{M}$ can be synthesised in two steps from simple reactants (Fig. 1). Sodium nitrite $\left(\mathrm{NaNO}_{2}\right)$ in cold aqueous hydrochloric acid is used as the reagent for the first step of the synthesis. Choose from the suggested reactants ( $\mathbf{N}$ to $\mathbf{Q}$ ) the ones that can provide $\mathbf{M}$ with very high regioselectivity.
```
Reactants: and
```

## Determination of the association constant $K_{t}$

$\beta$-cyclodextrin ( $\mathbf{C}$, Fig. 2) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In tasks 3 to 6 , we will determine by spectroscopy the association constant, $K_{\mathrm{t}}$, corresponding to the formation of the inclusion complex, $\mathrm{CM}_{\text {trans }}$, as depicted in Fig. 2.

Fig. 2 - Formation of the $\mathbf{C M}_{\text {trans }}$ inclusion complex.

Solutions are prepared by mixing $\mathbf{C}$ and $\mathbf{M}_{\text {trans }}$ in different proportions to reach initial concentrations $[\mathbf{C}]_{0}$ and $\left[\mathbf{M}_{\text {trans }}\right]_{0}$. While $\left[\mathbf{M}_{\text {trans }}\right]_{0}$ is identical for all solutions, $[\mathbf{C}]_{0}$ varies. We measure the difference in absorbance, $\Delta A$, between the absorbance of each solution and the pure $\mathbf{M}_{\text {trans }}$ solution, at a fixed wavelength. The molar absorption coefficients of $\mathbf{C} \mathbf{M}_{\text {trans }}$ and $\mathbf{M}_{\text {trans }}$ are $\varepsilon_{\text {CMtrans }}$ and $\varepsilon_{\text {Mtrans }}$ respectively. $L$ is the path length of the beam through the sample. The absorbance of $\mathbf{C}\left(\varepsilon_{\mathrm{C}}\right)$ is negligible.
3. Show that $\Delta A=\alpha\left[\mathbf{C M}_{\text {trans }}\right]$ and express $\alpha$ in terms of the known constant(s).

4. Show that when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}\left(\right.$ i.e. $\left.[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}\right)$, the concentration of $\mathbf{C}$ may be considered as constant, $[\mathbf{C}] \simeq[\mathbf{C}]_{0}$.
Working:
5. Show that, when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}$ (i.e. $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}$ ), $\Delta A=\alpha \frac{\beta[\mathrm{C}]_{0}}{1+K_{\mathrm{t}}[\mathrm{C}]_{0}}$ and express $\beta$ in terms of the constant(s) and initial concentration(s).
$\square$
6. Determine $K_{\mathrm{t}}$ using the following experimental curve (Fig. 3).

Fig. 3 - Evolution of $1 / \Delta A$ as a function of $1 /[C] 0$.
Working:

$$
K_{\mathrm{t}}=
$$

## Candidate: GBR-1

## Determination of the association constant, $K_{c}$

Tasks 7 to 9 allow the determination of the association constant, $K_{\mathrm{c}}$, corresponding to the formation of $\mathbf{C M} \mathbf{M i s}_{\text {cis }}$, the inclusion complex with $\mathbf{M}_{\text {cis }}$,

A pure sample of $\mathbf{M}_{\text {trans }}$ is irradiated, producing a known amount of $\mathbf{M}_{\mathrm{cis}},\left[\mathbf{M}_{\mathrm{cis}}\right]_{0}$.
$\mathbf{M}_{\text {cis }}$ (free or within the inclusion complex) then thermally isomerises into $\mathbf{M}_{\text {trans }}$.
In the absence of $\mathbf{C}$, the isomerisation follows first order kinetics with a rate constant, $k_{1}$. All complexation equilibria are faster than the isomerisation processes.

The kinetic scheme corresponding to this experiment is provided in Fig. 4.

Fig. 4 - Kinetic scheme for the isomerisation of $\boldsymbol{M}_{\mathbf{c i s}}$ in the presence of $\boldsymbol{C}$.

The rate of disappearance, $r$, of the total amount of $\mathbf{M}_{\text {cis }}$ (free and complexed) is defined as

$$
r=k_{1}\left[\mathbf{M}_{\mathrm{cis}}\right]+k_{2}\left[\mathbf{C M}_{\mathrm{cis}}\right]
$$

Experimentally, $r$ follows an apparent first order rate law with a rate constant $k_{\text {obs }}$ :

$$
r=k_{\mathrm{obs}}\left(\left[\mathbf{M}_{\mathrm{ids}}\right]+\left[\mathbf{C M}_{\mathrm{cis}}\right]\right)
$$

7. Show that $k_{\mathrm{obs}}=\frac{\gamma+\delta k_{2}[\mathbf{C}]}{1+K_{\mathrm{c}}[\mathbf{C}]}$ and express $\gamma$ and $\delta$ in terms of known constant(s).

Working:
$\gamma=$
and
$\delta=$

## Candidate: GBR-1

8. Choose under which condition(s) the half-life, $t_{1 / 2}$, corresponding to $k_{\text {obs }}$ can be expressed as
$t_{1 / 2}=\frac{\ln 2}{\gamma}\left(1+K_{\mathrm{c}}[\mathbf{C}]_{0}\right)$ given that $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {cis }}\right]_{0}$. Mathematically justify your answer.

| $\square$ | Very slow isomerisation of $\mathbf{M}_{\text {cis }}$ within cyclodextrin |
| :--- | :--- |
| $\square$ | Very slow isomerisation of free $\mathbf{M}_{\text {cis }}$ |
| $\square$ | $\mathbf{C M}_{\text {cis }}$ very stable |
| $\square$ | $\mathbf{C M}_{\text {trans }}$ very stable |
| Working: |  |
|  |  |
|  |  |
|  |  |
|  |  |

9. Assuming the condition(s) in task 8 are satisfied, calculate $K_{\mathrm{c}}$ by a linear regression using the data below. You may use a calculator or plot a graph.

| $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ | $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ |
| :---: | :---: | :---: | :---: |
| 0 | 3.0 | $3.0 \times 10^{-3}$ | 5.9 |
| $1.0 \times 10^{-4}$ | 3.2 | $5.0 \times 10^{-3}$ | 7.7 |
| $5.0 \times 10^{-4}$ | 3.6 | $7.5 \times 10^{-3}$ | 9.9 |
| $1.0 \times 10^{-3}$ | 4.1 | $1.0 \times 10^{-2}$ | 12.6 |

Candidate: GBR-1

Equation of the linear regression:

## Formation of nanomachines

Fig. 5 - Cleavage of an azobenzene-cyclodextrin inclusion complex induced by a lighttriggered isomerisation, which allows delivery of the drug (grey circles).

Another azobenzene compound (for which $K_{\mathrm{c}} \ll K_{\mathrm{t}}$ ) is initially in the trans form. This is covalently grafted onto silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, shown as grey circles in Fig. 5). Upon addition of $\mathbf{C}$, an inclusion complex is formed, which blocks the pores and prevents the release of the dye.
10. Tick the most appropriate box (one choice only) for the necessary condition(s) so that the pores are initially blocked in the presence of $\mathbf{C}$ and the dye can be released upon irradiation.

```
\square K
\square K K
\square K K}/\mp@subsup{K}{\textrm{c}}{}<<
\square K
\square K
```

This azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that the this powder cannot move into solution. The powder is irradiated at a wavelength $\lambda_{1}$ to trigger the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength $\lambda_{2}$.

Fig. 6 - Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (solid line), cis-azobenzene (dotted line) and rhodamine B (dashed line).
11. Determine $\lambda_{1}$.
$\lambda_{1}=\quad \mathrm{nm}$
12. Determine $\lambda_{2}$.

```
\lambda2= nm

## Problem T6: Characterisation of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterisation of such macromolecules are studied.

## Study of the first block

In this first part, we will study the water soluble homopolymer 1 ( $\alpha$-methoxy- $\omega$ aminopolyethyleneglycol).
The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}\left(\mathrm{DMSO}-d_{6}, 60^{\circ} \mathrm{C}, 500 \mathrm{MHz}\right.$ ) includes the following signals:

| Index | $\boldsymbol{\delta}$ (ppm) | Peak Area |
| :---: | :---: | :---: |
| a | $2.7^{*}$ | 0.6 |
| b | 3.3 | 0.9 |
| c | 3.4 | 0.6 |
| d | $\sim 3.5$ | 133.7 |

Table 1, *in the presence of $\mathrm{D}_{2} \mathrm{O}$, the signal at 2.7 ppm disappears.

1. Match the ${ }^{1} \mathrm{H}$ NMR signals ( $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ ) from Table 1 with each of the corresponding protons.

## Candidate: GBR-1

2. Express the average degree of polymerization, $n$, as a function of the area, $A_{\mathrm{OC} 2 \mathrm{H} 4}$, of the NMR peak of the repeating unit and the area, $A_{\mathrm{OCH}}$, of the NMR peak of the methyl end group. Calculate $n$.
$\square$

## Study of a diblock-copolymer

The second block of the copolymer is synthesised by the reaction of $\mathbf{1}$ with $\mathbf{2}$ ( $\varepsilon$-(benzyloxycarbonyl)-lysine $N$-carboxyanhydride). This yields block-copolymer 3 .

3. Draw the reaction intermediate that is formed in the first step of the addition of $\mathbf{1}$ to $\mathbf{2}$.

Draw the structure of $\mathbf{G}$, a gas molecule formed in the second step of the mechanism.

$\square$
4. Infrared (IR) measurements were used to characterise the compounds. Match the three IR spectra with compounds $\mathbf{1 , 2}$ and 3.

5. The ${ }^{1} \mathrm{H}$ NMR spectrum of copolymer 3 (in DMSO- $d_{6}$, at $60^{\circ} \mathrm{C}, 500 \mathrm{MHz}$ ) is reported in Fig. 1. Using some or all of the NMR signals, the areas of which are reported in Table 2, calculate its number average molar mass $M_{\mathrm{n}}$, using your value of $n$ from question 2. For your calculations, draw a circle around the group(s) of atoms you used and give their corresponding symbol(s) ( $\alpha, \beta \ldots)$.

Table 2

| Peak | Area |
| :---: | :---: |
| $\alpha$ | 22.4 |
| $\beta$ | 119 |
| $\gamma$ | 23.8 |
| $\delta$ | 47.6 |
| $\varepsilon$ | 622 |

Fig. 1 - signals marked with * correspond to the solvent and water.

This reaction of $\mathbf{1}$ with $\mathbf{2}$ yielded the copolymers $\mathbf{3 a}$ after $20 \mathrm{~h}, \mathbf{3 b}$ after 25 h and $\mathbf{3 c}$ after 30 h at $40^{\circ} \mathrm{C}$. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

Fig. 2 -SEC chromatograms of 3a, 3b and $\mathbf{3 c}$ against the elution volume, $V_{e}$.
6. Match the signals in Fig. 2 with the copolymers 3a, 3b and 3c.

| 3a: | $\square X$ | $\square Y$ | $\square Z$ |
| :--- | :--- | :--- | :--- |
| 3b: | $\square X$ | $\square Y$ | $\square Z$ |
| 3c: | $\square X$ | $\square Y$ | $\square Z$ |

In order to calibrate the chromatogram, a mixture of standard polymers of known masses ( $3,30,130,700$ and $7000 \mathrm{~kg} \mathrm{~mol}^{-1}$ ) has been studied (Fig. 3).
The $\log$ value of the molar mass is a linear function of the elution volume, $V_{\mathrm{e}}$.

Fig. 3 - SEC chromatogram of the mixture of standards.

## Candidate: GBR-1

7. Based on the SEC curves in Fig. 2 and 3, determine $V_{\mathrm{e}}$ of the polymer that corresponds to curve $X$ and use it to estimate the degree of polymerization, $m$, of its second block. Show your calculation; you may use a calculator or plot a graph.

$$
V_{\mathrm{e}}=\quad \mathrm{mL}
$$

## Candidate: GBR-1

## Triblock copolymer synthesis

For biological applications, involving the formation of micelles, a triblock copolymer $\mathbf{9}$ can be synthesised through the introduction of a middle block, B, using monomer 5.

8. Draw the structures of $\mathbf{5 , 7} \mathbf{7}$ and $\mathbf{8}$.

5 (no other products than 6:A-B are obtained)

7 (a gas is formed in the final step)

8

## Candidate: GBR-1

9. Amphiphilic block copolymers, such as 9: A-B-C, can be used for medical applications, as they self-assemble into micelles in water ( $\mathrm{pH}=7$ ), which can be used as drug carriers. Assign each block of the copolymer to a property. Draw a scheme of the micelle with only 4 polymer chains.

| A: | $\square$ hydrophobic | $\square$ hydrophilic |  |  |

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart (a Brit!) and B. L. Feringa "for the design and synthesis of molecular machines". An example of these is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper ( +I or +II ), two configurations are obtained (Fig. 1).

Fig. 1 - Multi-stability of a ring in a [2]catenane.
The synthesis of the macrocycle is the following:

1. Draw the structure of $\mathbf{B}$.
$\square$
2. Draw the structures of $\mathbf{E}, \mathbf{F}$ and $\mathbf{G}$.

| E |
| :--- | :--- |
|  |
| F |
|  |

3. From the following the reaction conditions, choose which one(s) can produce $\mathbf{E}$ from $\mathbf{D}$ :

| $\square$ | $\mathrm{H}^{+}, \mathrm{H}_{2} \mathrm{O}$ |
| :--- | :--- |
| $\square$ | $\mathrm{OH}^{-}, \mathrm{H}_{2} \mathrm{O}$ |
| $\square$ | $\mathrm{NaBH}_{4}, \mathrm{CH}$ |
| 3 |  |

4. In this synthesis, MsCl is used to obtain:
```
\(\square\) a leaving group
\(\square\) a protecting group
\(\square\) a deactivating group
\(\square\) a directing group
```

## Candidate: GBR-1

5. $\mathbf{G}$ is obtained by the reaction between $\mathbf{F}$ and LiBr in acetone. This reaction is:

| $\square$ | electrophilic aromatic substitution |
| :--- | :--- |
| $\square$ | nucleophilic aromatic substitution |
| $\square$ | $\mathrm{S}_{\mathrm{N}} 1$ |
| $\square$ | $\mathrm{~S}_{\mathrm{N}} 2$ |

6. Draw the transition state of the rate-determining step of the reaction $\mathbf{F} \rightarrow \mathbf{G}$, showing the 3D geometry. Depict only one reaction centre. The main carbon chain can be represented as an R group.

Transition state:

The synthesis of [2]catenane $\mathbf{L}$ uses the template effect of a copper complex:

## Candidate: GBR-1

7. Write the full electronic configuration of $\mathrm{Cu}(0)$ in its ground state. Give the oxidation state of Cu in complex $\mathbf{J}$ and write the electronic configuration of Cu in the free ion corresponding to $\mathbf{J}$.
Electronic configuration of $\mathrm{Cu}(0)$ :

Oxidation state of $\mathbf{C u}$ in $\mathbf{J}$ :

Electronic configuration of Cu in $\mathbf{J}$ :
8. Select the geometry of the copper ion in $\mathbf{L}$. Assuming an ideal geometry of the ligands around the copper centre, draw an energy level diagram showing the behavior of the d orbitals in the crystal field. Fill the orbital diagram. Give the maximum value of the spin $(S)$ for this complex.

The geometry of Cu in $\mathbf{L}$ is:
$\square$ Octahedral
$\square$ Tetrahedral
$\square$ Square planar
$\square$ Trigonal bipyramid
Splitting and filling of d orbitals:

$$
S=
$$

9. From the following compounds, choose the one(s) that can remove the copper ion in $\mathbf{L}$ to obtain the free [2]catenane:

|  |  |  |
| :--- | :--- | :--- |
| $\square$ | $\mathrm{CH}_{3} \mathrm{CN}$ |  |
| $\square$ | $\mathrm{NH}_{4} \mathrm{PF}_{6}$ |  |
| $\square$ | KCN | tren |
| $\square$ tren | (2) |  |

In [2]catenane $\mathbf{L}$, the copper ion can exist in two oxidation states $(+\mathrm{I})$ or (+II), each exhibiting a different coordination sphere (tetra- or penta-coordinated, respectively).

Fig. 2 - [2]catenane $\mathbf{L}$ states
The stability of $\mathrm{Cu}(\mathrm{I})$ complexes can be inferred by comparing their electronic structures to that of a noble gas.
10. Fill in the blanks with a number or a tick:

The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex has $\ldots$ electrons in the coordination sphere of the metal.
The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{5}$ complex has $\ldots$ electrons in the coordination sphere of the metal.
The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex is $\square$ more / $\square$ less stable than the $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{5}$ complex.
11. Fill in the solid boxes with the labels for the complexes in Fig. 2 and complete the sequence to achieve electrochemical control of the system using the following notation for the dashed boxes: $\square$ (a rotation); + $\mathrm{e}^{-}$; - $\mathrm{e}^{-}$.

## Problem T8: Identification and synthesis of inositols

In this problem, we define " 3 D structure" and "perspective formula" as indicated for $\beta$-glucose in the following figure.

3D structure

perspective formula

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular myo-inositol, are involved in a number of biological processes.

## Structure of myo-inositol

1. Draw the structural formula of inositols, without stereochemical details.

This group of molecules contains 9 stereoisomers, including enantiomers.
2. Draw the 3D structures of all optically active stereoisomers.

## Candidate: GBR-1

The structure of a specific inositol, called myo-inositol, is studied here. Only one of its chair conformers is predominant and its structure can be deduced from its ${ }^{1} \mathrm{H}$ NMR spectrum. The spectrum below was obtained at 600 MHz in $\mathrm{D}_{2} \mathrm{O}$. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.
(
3. State the molecular formula of the predominant compound derived from myo-inositol in this sample that is consistent with the number of protons observed in the ${ }^{1} \mathrm{H}$ NMR spectrum.
$\square$
4. Based on the number and integrations of the proton signals, state the number of symmetry plane(s) in this molecule.
5. Complete the perspective drawing of the most stable conformation of myo-inositol. Then label each hydrogen with the corresponding letter ( $\mathbf{a}, \mathbf{b}, \mathbf{c}$ or $\mathbf{d}$ ) according to the NMR spectrum above. Proton a must be on carbon a. Draw its 3D structure.
3D structure:

## Candidate: GBR-1

## Synthesis of inositols

For medicinal applications, it is useful to synthesise some inositol phosphates on a large scale. We will study the synthesis of inositol $\mathbf{2}$ from bromodiol 1.

6. Choose the correct relationship(s) between $\mathbf{2}$ and $\mathbf{3}$.

Inositol $\mathbf{2}$ can be obtained from compound $\mathbf{1}$ in 7 steps.

## Candidate: GBR-1

7. Draw the 3D structure of 4 .

8. The reaction leading to $\mathbf{5}$ occurs on the double bond with the highest electron density. Consider the structure of 1-bromo-1,3-cyclohexadiene, which is a substructure of 4 . Circle the double bond with the highest electron density. Represent all the electronic effects due to the bromine on separate diagrams.

9. Draw the 3D structure of the major diastereomer 5.

5
10. State the total number of stereoisomers of $\mathbf{5}$ possibly obtained in this synthesis, starting from the enantiopure compound $\mathbf{1}$.
$\square$
11. For the step $\mathbf{5} \rightarrow \mathbf{6}$, another product with the same molecular formula, denoted $\mathbf{6}$, can be produced. Draw the 3D structures of 6 and $\mathbf{6}^{\prime}$.

12. Draw the 3D structures of major diastereomers $\mathbf{8}$ and $\mathbf{9}$.

13. Select the most appropriate conditions $\mathbf{A}$ to obtain 2.
$\square \mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$
$\square \mathrm{K}_{2} \mathrm{CO}_{3}$, HF
$\square \mathrm{HCOOH}, \mathrm{H}_{2} \mathrm{O}$
$\square \mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$

## Candidate: GBR-1

14. If the bromine is not present in compound $\mathbf{1}$, in addition to $\mathbf{2}$, another stereoisomer would be obtained. Considering the stereoselectivity of the reactions remains unchanged and that the following steps involve the same number of equivalents as for $\mathbf{2}$, draw the 3D structure of this stereoisomer and give its relationship with 2.
$\square$
15. During the synthesis of $\mathbf{2}$ from $\mathbf{1}$, choose the removal step(s) of protecting or directing groups.
$\square 1 \rightarrow 4$
$\square \mathbf{4} \rightarrow \mathbf{5}$
$\square 5 \rightarrow 6$
$\square \mathbf{6} \rightarrow 7$
$\square 7 \rightarrow 8$
$\square \mathbf{8} \rightarrow \mathbf{9}$
$\square \mathbf{9} \rightarrow \mathbf{2}$

| Problem <br> T9 <br> $\mathbf{7 \%}$ | Question | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ | $\mathbf{1 1}$ | $\mathbf{1 2}$ | $\mathbf{1 3}$ | Total |

## Problem T9: Synthesis of levobupivacaine

## Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesised from the natural amino acid L-lysine.

1. Assign the absolute configuration of the stereogenic centre in L-lysine hydrochloride and justify your answer by classifying the substituents in order of their priority.

| Configuration: | Priority $1>2>3>4$ : |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \square R \\ & \square S \end{aligned}$ |  | $\mathrm{NH}_{3}^{+}$ | ${ }^{3} \mathrm{COO}$ | ${ }^{\text {H }}$ |

2. The prefix L in L-lysine refers to relative configuration. Choose all correct statements:All natural L-amino acids are levorotatory.Natural L-amino acids can be levorotatory or dextrorotatory.
$\square$ All natural L-amino acids are ( $S$ ).
$\square$ All natural L -amino acids are $(R)$

Often, we want only one of the amino groups in L-lysine to react. $\mathrm{A}_{\mathrm{Cu}}{ }^{2+}$ salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed $\mathrm{NH}_{2}$ group is available to react.
3. Considering that L-lysine acts as a bidentate ligand and that two L-lysines coordinate to one $\mathrm{Cu}^{2+}$ ion in the presence of aqueous hydroxide, draw the structure of the intermediate complex.

## Complex

## Candidate: GBR-1

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without the $\mathrm{Cu}^{2+}$ salt.

(benzyloxycarbonyl chloride) ( $N, N^{\prime}$-dicyclohexylcarbodiimide) ( $p$-toluenesulfonyl chloride) From this point on, you can use the abbreviations proposed in the scheme above.
4. Draw the structure of compound $\mathbf{A}$, including the appropriate stereochemistry.
$\square$
5. The transformation of L-lysine into $\mathbf{A}$ is (select the correct answer(s)):$\square$ an enantioselective reaction. an enantiospecific reaction. a regioselective reaction.
6. Draw the structures of compounds $\mathbf{B}-\mathbf{F}$, including the appropriate stereochemistry.

| B $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}$ | C $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{6}$ |  |
| :--- | :--- | :--- |
|  |  |  |
| D |  |  |

7. What is the role of DCC in the transformation $\mathbf{C} \rightarrow \mathbf{D}$ ?
$\square$ Protecting group for the amino group.
$\square$ Protecting group for the hydroxy group.Activating agent for the amide bond formation.
8. TsCl is used in the synthesis to enable:
$\square$ Nucleophilic substitution of an amino group.
$\square$ Electrophilic substitution of an amino group.
$\square$ Nucleophilic substitution of a hydroxy group.Electrophilic substitution of a hydroxy group.

## Candidate: GBR-1

9. Select all possible reagents which could be used as reagent $\mathbf{H}$ :

| $\square$ diluted HCl | $\square \mathrm{Zn} / \mathrm{HCl}$ |
| :--- | :--- |
| $\square \mathrm{K}_{2} \mathrm{CO}_{3}$ | $\square \mathrm{H}_{2} \mathrm{SO}_{4}$ |
| $\square$ diluted $\mathrm{KMnO}_{4}$ | $\square$ diluted NaOH |
| $\square \mathrm{SOCl}_{2}$ | $\square \mathrm{PCl}_{5}$ |

10. Draw the structure of levobupivacaine, including the appropriate stereochemistry.

Levobupivacaine $\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}$

## Part II.

The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of amino acids is their transformation into amides using Mosher's acid (see the structure of the ( $S$ ) isomer below).

11. Draw the structure of the amide formed when the $\alpha$-amino group of L-lysine reacts with (S)-Mosher's acid. Clearly show the stereochemistry of each chiral centre.

## Candidate: GBR-1

12. How many products will be formed from racemic lysine and ( $S$ )-Mosher's acid (consider that only the $\alpha$-amino group of lysine reacts)?
$\square$ Two diastereoisomers.
$\square$ Four diastereoisomers.
$\square$ A racemic mixture of two enantiomers.Four compounds: two enantiomers and two diastereoisomers.
13. Select the method(s) which can be used to quantitatively determine the enantiomeric purity of lysine after its reaction with (S)-Mosher's acid:NMR spectroscopy.Liquid chromatography.
Mass spectrometry.UV-vis spectroscopy.
