# THEORETICAL EXAM

Making science together!

2019-07-26

MINISTÈRE DE L'ÉDUCATION NATIONALE ET DE LA JEUNESSE

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR, DE LA RECHERCHE ET DE L'INNOVATION

#### **General instructions**

- This theoretical exam booklet contains 61 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective designed areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designed areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30-minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by ½ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

#### **GOOD LUCK!**

## **Table of Contents**

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

Problem T1: Infinite well and butadiene	(6%)	p. 8
Problem T2: Hydrogen production by water-splitting	(7%)	p. 13
Problem T3: About silver chloride	(5%)	p. 19
Problem T4: From black powder to the discovery of iodine	(7%)	p. 24
Problem T5: Complexes for the formation of nanomachines	(8%)	p. 31
Problem T6: Characterization of a block-copolymer	(8%)	p. 39
Problem T7: Ring motion in a [2]catenane	(6%)	p. 48
Problem T8: Identification and synthesis of inositols	(6%)	p. 53
Problem T9: Synthesis of levobupivacaine	(7%)	p. 58

#### Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in mol L<sup>-1</sup>. To further simplify formulas and expressions, the standard concentration  $c^{\circ} = 1 \text{ mol } L^{-1} \text{ is omitted.}$

#### Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written  $CH_2$ =CH-CH= $CH_2$ , with alternating single and double bonds. The chemical reactivity is not consistent with this description and the  $\pi$  electrons are better described by a distribution along the three bonds:

$$C = C = C = C$$

This system can be modelled as a one-dimensional box (that is, infinite well) where electrons are free. The energy of an electron in an infinite well of length L is:  $E_n = \frac{n^2h^2}{8m_eL^2}$ , where n is a **non-zero** positive integer.

1. Two different models are studied. **Sketch** at least the three lowest-energy levels  $E_n$  **for each model** in the respective diagrams, showing how the relative energy levels differ within and between models.

51st IChO - Theoretical Exam

localized in the terminal bonds and exist in two

separate infinite potential wells of length d.

delocalized on the whole molecule and exist in a

single infinite potential well of length 3d.

2.	<u>Place</u> the $\pi$ electrons for model 1 in the previous diagrams and <u>express</u> the total energy of the $\pi$ system in model 1, as a function of $h$ , $m_e$ and $d$ .						
E(	1) =						
3.	<u>Place</u> the $\pi$ electrons for model 2 in the previous diagrams and <u>express</u> the total energy of the $\pi$ system in model 2, as a function of $h$ , $m_e$ and $d$ .						
E	(2) —						
	(2) =						
eth	e conjugation energy is the total energy of the actual $\pi$ system, minus the sum of the energies of sylene molecules involving the same number of electrons.						
4.	Express the conjugation energy $\Delta E_c$ of butadiene, as a function of $h$ , $m_e$ and $d$ .						
$\Delta I$	$E_{ m c} =$						
Mo	Models 1 and 2 are too simplistic. A new model will be detailed in the following.						
5.	<u>Draw</u> three other resonance structures of butadiene using Lewis notation.						
	$H_2C$ $CH_2$						

To take into account the size of carbon atoms, model 2 is now modified to model 3, as follows:

- the new length of the well is L and is located between the abscissa 0 and L;
- the carbon atoms are located at the abscissas L/8; 3L/8; 5L/8 and 7L/8.

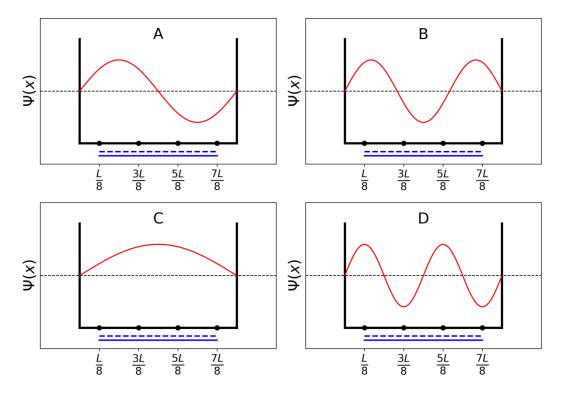

For each level n, the  $\pi$  wavefunction is:

$$\psi_{\rm n}(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$$

and the  $\pi$  electron density for a system with  $N \pi$  electrons is:

$$\rho(x) = 2 \sum_{i=1}^{N/2} |\psi_i(x)|^2$$

The four  $\pi$  wavefunctions, which correspond to the molecular orbitals of the  $\pi$  system, are depicted below (**arbitrary order**).

6. **Rank** the energies of the four  $\pi$  wavefunctions ( $E_A$ ,  $E_B$ ,  $E_C$  and  $E_D$ ).

< < <

7. Give the labels (A, B, C or D) of the orbitals that are filled with electrons in butadiene.

8. Within model 3, <u>give</u> the values of the  $\pi$  wavefunctions  $\psi_n$  for occupied levels at positions 0, L/4 and L/2, for n = 1 and n = 2, as a function of L.

 $\psi_1(0) =$ 

 $\psi_1\left(\frac{L}{4}\right) =$ 

 $\psi_1\left(\frac{L}{2}\right) =$ 

 $\psi_{2}(0) =$ 

 $\psi_2\left(\frac{L}{4}\right) =$ 

 $\psi_2\left(\frac{L}{2}\right) =$ 

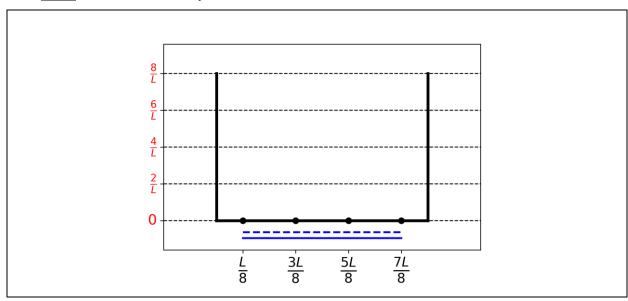

9. Within model 3, **give** the value of the  $\pi$  electron density at positions 0, L/4 and L/2.

$$\rho(0) =$$

$$\rho\left(\frac{L}{4}\right) =$$

$$\rho\left(\frac{L}{2}\right) =$$

10. **Draw** the  $\pi$  electron density between 0 and L.

- 11. **Rank** the following CC bonds (B1, B2, ..., B5) by increasing length, using the symbols = or <:
  - B1: C1C2 in the butadiene molecule
  - B2: C2C3 in the butadiene molecule
  - B3: C3C4 in the butadiene molecule
  - B4: CC in the ethane molecule
  - B5: CC in the ethene molecule

# Problem T2: Hydrogen production by water-splitting

#### Data:

Compound	$H_2(g)$	H <sub>2</sub> O(l)	H <sub>2</sub> O(g)	$O_2(g)$
$\Delta_{\rm f} H^{\circ} / {\rm kJ \ mol^{-1}}$	0	-285.8	-241.8	0
$S_{\rm m}^{\circ}$ /J mol <sup>-1</sup> K <sup>-1</sup>	130.6	69.9	188.7	205.2

Molecular hydrogen  $(H_2)$  can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1.	<u>Write</u> the balanced equation for the splitting reaction of liquid water <u>using a stoichiometric</u> <u>coefficient of 1 for water</u> .
2.	Using only the provided thermodynamic data, <b>justify numerically</b> whether this reaction is thermodynamically favorable at 298 K.
Ca	lculations:
Re	action thermodynamically favorable?
	□ Yes □ No

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected by a generator (Fig. 1). Gas bubbles are formed at both electrodes.

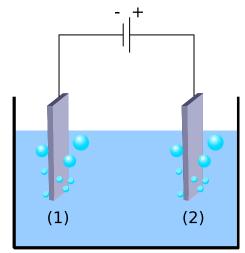

Fig. 1 – Water-splitting electrochemical cell.

3. Write the balanced net electrochemical half reactions occurring at each electrode.

On electrode (1):			
On electrode (2):			

4. Using only the provided thermodynamic data (or question 2), <u>derive</u> the condition on the applied voltage between electrodes  $\Delta E_{\text{applied}}$  compared to a value  $\Delta E_{\text{th}}$  for the process to be thermodynamically favorable at 298 K, when all reactants and products are in their standard state. <u>Tick</u> the right condition and <u>give</u> the numerical value with 3 decimal places.

G 1	1	
Cal	culation:	
	$\Delta E_{\rm applied} = \Delta E_{\rm th}$	
	$\Delta E_{ m applied} > \Delta E_{ m th}$	where $\Delta E_{\text{th}} = \dots V$ (give the result with 3 dp)
	$\Delta E_{ m applied} < \Delta E_{ m th}$	
	If you could not calcul	ate $\Delta E_{th}$ , the value 1.200 V can be used in the rest of the problem.

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting,  $\Delta E_{\text{min}}$ , depends on the nature of the anode, as displayed in the table below:

Anode	$\Delta E_{\min}(V)$
$IrO_x$	1.6
$NiO_x$	1.7
$CoO_x$	1.7
$Fe_2O_3$	1.9

The difference between  $\Delta E_{\min}$  and  $\Delta E_{th}$  is responsible for losses in the device.

5. Write the expression for the device power efficiency  $\eta_{\text{elec}}$  (fraction of the power used for water splitting) as a function of  $\Delta E_{\text{th}}$  and  $\Delta E_{\text{min}}$ . Assuming an identical current value I, calculate the water electrolysis power efficiency when a Pt cathode and a Fe<sub>2</sub>O<sub>3</sub> anode are used. Give the most efficient anode.

$\eta_{ m elec}$ $=$	
Power efficiency whe	en a Pt and a Fe <sub>2</sub> O <sub>3</sub> electrodes are used:
$\eta_{ m elec}$ $=$	%
Most efficient anode:	
If you could not c	alculate $\eta_{\text{elec}}$ , the value $\eta_{\text{elec}} = 75\%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

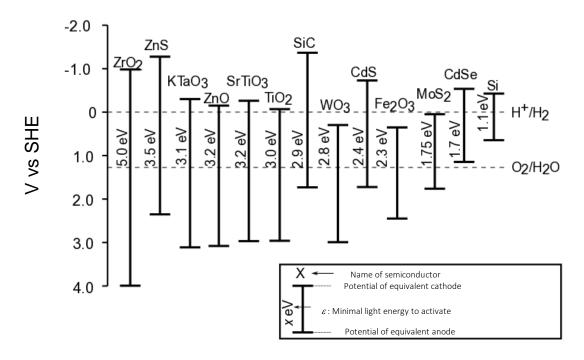

Fig. 2 – Activation condition and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard Hydrogen Electrode

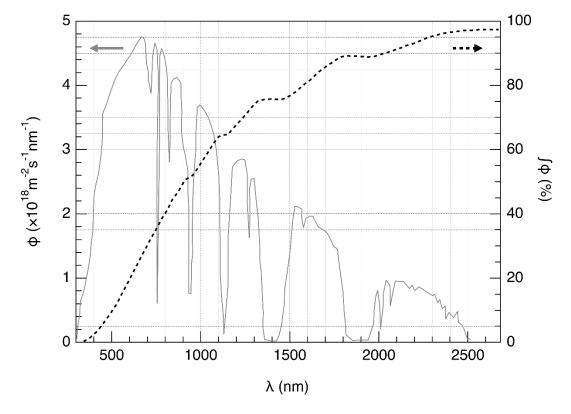

Fig. 3 – Left axis: Spectral distribution of the solar photon flux  $\phi$ . The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (that is fraction of the photon flux with smaller wavelength).

6. <u>Estimate</u> the fraction of the so CdS, Si. <u>State</u> explicitly the ed	_		he following semiconductors: TiO <sub>2</sub> , emputation.
Explanation / calculation:			
		Approximate	
		fraction	
	TiO <sub>2</sub>	%	
	CdS	%	
	Si	%	
The activation of the semi-conduct seen as two electrodes of different		in a modification of the	e surface potentials, so that it can be
7. Using the data in Fig 2, <b>choos</b>	e the sem	iconductor(s) in the foll	owing list that, once activated, can
play both roles of anode and c			
$\Box$ ZrO <sub>2</sub> $\Box$ ZnO		□ TiO <sub>2</sub>	$\square$ WO <sub>3</sub>
$\Box$ CdS $\Box$ Fe <sub>2</sub> O <sub>3</sub>		□ CdSe	□ Si
			is expected to be the most efficient
for water splitting upon a give	n solar sh	ınıng.	

The evolution of  $H_2$  and  $O_2$  was recently studied for a semiconductor irradiated by simulated solar light at T=25 °C at  $p_{\rm atm}$ . Using an incident power light of P=1.0 kW m<sup>-2</sup> and a photoelectrode with a S=16 mm<sup>2</sup> surface, the production of V=0.37 cm<sup>3</sup> of  $H_2(g)$  was measured after  $\Delta t=1$  hour.

9. Calculate the power efficiency $\eta_{\text{direct}}$ of the conversion.	
Calculation:	
$\eta_{ m direct} =$ %	
If you could not calculate $\eta_{\text{direct}}$ , the value $\eta_{\text{direct}} = 10\%$ can be used in the rest of the problem.	
Two modes of converting solar energy to hydrogen can be compared: direct photocatalysis, and indirect photo-electrolysis combining a photovoltaic panel with an electrolyzer. The efficiency of	
photovoltaic panels on the market is around $\eta_{\text{panels}} = 20\%$ .	
10. Compare the power efficiencies of the two modes, $\eta_{\text{direct}}$ and $\eta_{\text{indirect}}$ , using Fe <sub>2</sub> O <sub>3</sub> and Pt electrons	ndes
for the electrolysis.	, acs
Calculation:	
$oxed{\Box \eta_{ ext{direct}} > \eta_{ ext{indirect}}} oxed{\Box \eta_{ ext{direct}}} pprox \eta_{ ext{indirect}} oxed{\Box \eta_{ ext{direct}} < \eta_{ ext{indirect}}}$

#### **Problem T3: About silver chloride**

#### **Data at 298 K:**

 $pK_{s1}(AgCl) = 9.7; pK_{s2}(Ag_2CrO_4) = 12$ 

Formation constant of the complex  $[Ag(NH_3)_n]^+$ :  $\beta_n = 10^{7.2}$ 

Potentials against the standard hydrogen electrode:

Standard potential of  $Ag^+/Ag(s)$ :  $E^{\circ}(Ag^+/Ag(s)) = 0.80 \text{ V}$ 

Apparent potential of  $O_2(aq)/HO^-(aq)$  (in seawater):  $E'(O_2(aq)/HO^-(aq)) = 0.75 \text{ V}$ 

#### Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778–1850) deal with some properties of silver chloride.

**Quote A:** "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."

Quote B: "This salt has no taste since it is insoluble."

**Quote C:** "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."

Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."

**Quote E:** "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."

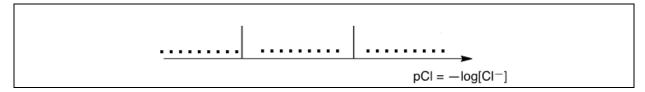

**Quote F:** "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

1.	<b>Quote A:</b> Write the balanced chemical equation for AgCl(s) synthesis.

2. **Quote B:** Calculate the solubility s of AgCl(s) in water at 298 K in mol  $L^{-1}$ .

Calculation:		
	s =	$mol L^{-1}$

3. **Quote C:** In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry 1:2 is formed. On the following qualitative axis (with pCl increasing from left to right), **place** in each domain the silver-containing species that is predominant (or exists, for solids). pCl values at the boundaries are not expected.

**Quote D:** When ammonia is added to silver chloride, a well-defined complex of stoichiometry n is formed.

4. Write the balanced equation for the synthesis of the complex [Ag(NH<sub>3</sub>)<sub>n</sub>]<sup>+</sup> from silver chloride and calculate the corresponding equilibrium constant.

Equation:	
Calculation:	
	K =
If you could not calculate $K$ , use $K = 10$	$f^{-3}$ for the rest of the problem.

5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears. At this moment,  $[NH_3] = 1.78 \text{ mol } L^{-1}$ . **Determine** the stoichiometry of the complex neglecting dilution effects.

	Calculation:	
n =		n =

6.	Write the balanced chemical equation corresponding to quote E.
7.	Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions, <u>write</u> a balanced chemical equation corresponding to the formation of the solid mentioned in <b>quote F.</b> <u>Use a stoichiometric coefficient of 1 for dioxygen</u> . <u>Calculate</u> the equilibrium constant at 298 K.
Equ	uation:
Cal	culation:
	K =

#### Part B: The Mohr method

The Mohr method is based on the colorimetric titration of Cl<sup>-</sup> with Ag<sup>+</sup> in the presence of potassium chromate  $(2K^+, CrO_4^{2^-})$ . Three drops (~ 0.5 mL) of a  $K_2CrO_4$  solution at about  $7.76 \cdot 10^{-3}$  mol L<sup>-1</sup> are added to  $V_0 = 20.00$  mL of a sodium chloride solution of unknown concentration  $C_{Cl}$ . This solution is then titrated with silver nitrate  $(Ag^+, NO_3^-)$  at  $C_{Ag} = 0.050$  mol L<sup>-1</sup>, which immediately leads to the formation of solid **A**. A red precipitate (solid **B**) appears at  $V_{Ag} = 4.30$  mL.

# Problem T4: From gunpowder to the discovery of iodine

In the  $19^{th}$  century, the French entrepreneur B. Courtois specialized in production of nitrate **A**  $(\mathbf{M_A}(\mathrm{NO_3})_m)$ , used for gunpowder. Initially imported from Asia, **A** was later produced from nitrate **B**  $(\mathbf{M_B}(\mathrm{NO_3})_n)$  using an exchange reaction with compound **C**, obtained from algae.

1. Find the formulae of nitrates A and B knowing that they are anhydrous salts of alkali or alkaline-

earth metal ( $M_A$ and $M_B$ ). One nitrate cowhile the other contains $9 \pm 3$ w% of im the samples is 38.4 w% and 22.4 w% res	purities. Th	ne mass percen	tage of metals	$\mathbf{M_A}$ and $\mathbf{M_B}$ in
		•		
	<b>A</b> :		and <b>B</b> :	

To obtain  $\bf A$ , 262.2 g of solid compound  $\bf C$  were added to the solution containing 442.8 g of  $\bf B$ .  $\bf B$  is known to be in excess. As a result, 190.0 g of white precipitate  $\bf D$  were formed and removed by filtration. The filtrate was evaporated, and the obtained solid mixture  $\bf E$  was heated until the mass of the sample (containing only nitrites,  $NO_2^-$ ) was constant. The only gaseous product was dioxygen: 60.48 L at 0 °C at 1 atm. Dioxygen can be considered as an ideal gas.

2.	<u>Calculate</u> the composition (in w%) of n and <b>B</b> and no other impurities, and that	nixture <b>E</b> considering tha <b>C</b> was taken in a pure anl	t it contained only compounds <b>A</b> hydrous state.

Re	action between <b>B</b> and <b>C</b> :		

In 1811, when working with algae ashes, Courtois observed that copper vessels were worn out faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled the solution of concentrated sulfuric acid on the dry algae ashes: violet vapour instantly came out of the vessel (1, sulfuric acid is the oxidizing agent): iodine ( $I_2$ ) had just been discovered! Iodine was the cause of the copper corrosion (2). However, because of the medicinal applications of iodine, Courtois opened a factory to manufacture iodine by reaction of algae with chlorine (3). Iodine is currently prepared from the set of reactants ( $NO_3^-$ ,  $I^-$ ,  $H^+$ ) (4) or ( $IO_3^-$ ,  $I^-$ ,  $H^+$ ) (5).

4. Write balanced equations for reactions 1–5.

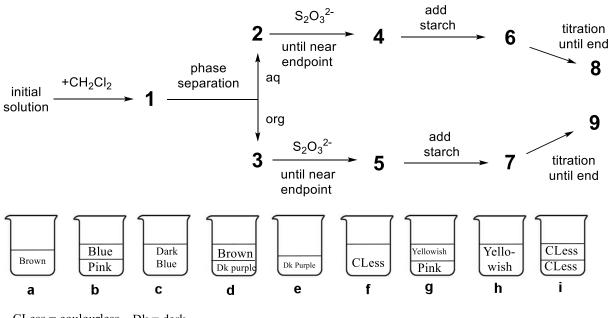

1		
2		
3		
4		
5		

The solubility of iodine is very low in water but significantly increases when iodide ions are added. Together they form ions such as triiodide,  $I_3^-$ :

$$\Gamma(aq) + I_2(aq) = I_3(aq)$$
 (6)

Equilibrium (6) can be studied through the extraction of  $I_2$  with dichloromethane.  $\Gamma$  and  $I_3^-$  do not dissolve in organic solvents but  $I_2$  does and, when extracted, it is 15 times more concentrated in dichloromethane than in water.

The following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide (0.1112 g). Then, 50.0 mL of dichloromethane was added, and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated by a standard aqueous solution of sodium thiosulphate pentahydrate (14.9080 g in 1.000 L of water) in the presence of starch. 16.20 mL was required for the organic phase and by 8.00 mL was required for the aqueous phase. The process is schematically represented below:

CLess = coulourless Dk = dark

# Problem T5: Azobenzene – β-cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable transformation of an energy source into a nanomovement for applications such as drug delivery. Numerous nanomachines make use of the isomerization of azo compounds (R-N=N-R') upon irradiation.

1. <u>Draw</u> the stereoisomers of azobenzene ( $H_5C_6-N=N-C_6H_5$ ). <u>Draw</u> a line between the two carbon atoms that are the furthest apart. <u>Compare</u> these two distances ( $d_{trans}$  and  $d_{cis}$ ).

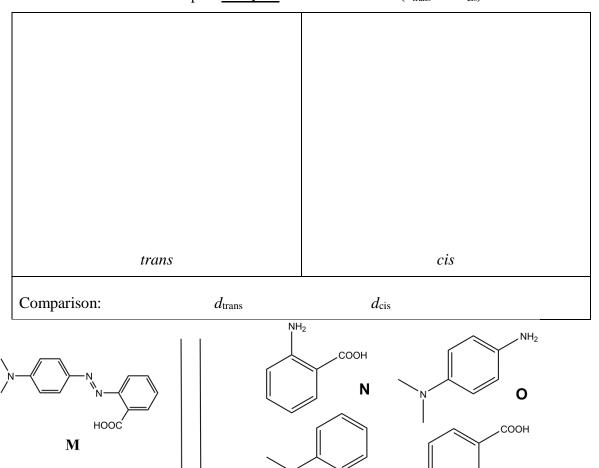

Fig. 1 – Possible reactants for the synthesis of M.

2. **M** can be synthesized in two steps from simple reactants (Fig. 1). <u>Choose</u> from the suggested reactants (**N** to **Q**) the ones that can provide **M** with very high regioselectivity. Sodium nitrite (NaNO<sub>2</sub>) in cold aqueous hydrochloric acid is used as reagent for the first step of the synthesis.

Q

#### Determination of the association constant $K_t$

β-cyclodextrin ( $\mathbf{C}$ , Fig. 2) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In tasks 3 to 6, we will determine by spectroscopy the association constant  $K_t$ , corresponding to the formation of the inclusion complex  $CM_{trans}$  as depicted in Fig. 2.

$$K_{t}$$
 $K_{t}$ 
 $K_{t$ 

Fig. 2 – Formation of the CM<sub>trans</sub> inclusion complex.

Several solutions are prepared by mixing C and  $M_{trans}$  in different proportions to reach initial concentrations  $[C]_0$  and  $[M_{trans}]_0$ . While  $[M_{trans}]_0$  is identical for all solutions,  $[C]_0$  varies. We follow, at a fixed wavelength, the evolution of the difference in absorbance  $\Delta A$  between each solution and the pure  $M_{trans}$  solution. The molar absorption coefficients of  $CM_{trans}$  and  $M_{trans}$  are respectively  $\varepsilon_{CMtrans}$  and  $\varepsilon_{Mtrans}$ . L is the path length of the beam through the sample. The absorbance of C ( $\varepsilon_{C}$ ) is negligible.

3. **<u>Demonstrate</u>** that  $\Delta A = \alpha \cdot [\mathbf{CM_{trans}}]$  and <u>express</u>  $\alpha$  in terms of known constant(s).

#### Determination of the association constant $K_c$

In tasks 7 to 9, we will determine by kinetic studies the association constant  $K_c$ , for formation of the inclusion complex  $\mathbf{CM}_{cis}$ . A sample containing only  $\mathbf{M}_{trans}$  is irradiated, thus producing a known amount of  $\mathbf{M}_{cis}$  and  $[\mathbf{M}_{cis}]_0$ .

 $\mathbf{M}_{cis}$  (free or within the inclusion complex) thermally isomerizes to  $\mathbf{M}_{trans}$ . In the absence of  $\mathbf{C}$ , the isomerization follows a first order kinetics with a rate constant  $k_1$ . All complexation equilibria are faster than the isomerization processes. The kinetic scheme corresponding to this experiment is provided in Fig. 4.

C 
$$K_{cis}$$
 $K_{c}$ 
 $K_{c}$ 

Fig. 4 – Kinetic scheme for the isomerization of  $M_{cis}$  in the presence of C.

The rate of disappearance r for the total amount of  $\mathbf{M}_{cis}$  (free and complexed) is defined as

$$r = k_1[\mathbf{M_{cis}}] + k_2[\mathbf{CM_{cis}}]$$

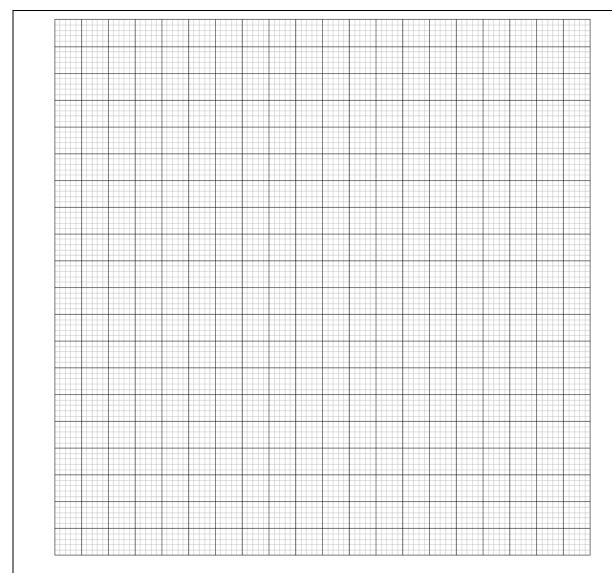

Experimentally, r follows an apparent first order kinetic law with an apparent rate constant  $k_{obs}$ :

$$r = k_{\text{obs}}([\mathbf{M_{cis}}] + [\mathbf{CM_{cis}}])$$

	<b>Demonstrate</b> that $R_{\text{obs}} =$	$=\frac{\gamma+\delta\cdot R_2[C]}{1+K_C[C]}$ and <b>express</b> $\gamma$	$\theta$ and $\delta$ in terms	s of known constant(s).

# Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule are studied.

#### Study of the first block

In this first part, we will study the water soluble homopolymer 1 ( $\alpha$ -methoxy- $\omega$ -aminopolyethyleneglycol). The <sup>1</sup>H NMR spectrum of 1 (DMSO- $d_6$ , 60 °C, 500 MHz) includes the following signals (DMSO is the solvent):

Index	δ (ppm)	Peak Area
a	2.7*	0.6
b	3.3	0.9
С	3.4	0.6
d	~ 3.5	133.7

Table 1, \*in the presence of  $D_2O$ , the signal at 2.7 ppm disappears.

1. Match the <sup>1</sup>H NMR signals (a, b, c, d) from Table 1 with each of the corresponding protons.

2.	<b>Express</b> the average degree of polymerization $n$ as a function of the area $A_{\text{OC2H4}}$ of the NMR peak
	of the repeating unit and the area $A_{\text{OCH3}}$ of the NMR peak of the methyl end group. Calculate $n$ .

n =

If you could not calculate n, n = 100 can be used in the rest of the problem.

## Study of a diblock-copolymer

The synthesis of the second block of the copolymer is performed through the reaction of 1 with 2 ( $\epsilon$ -(benzyloxycarbonyl)-lysine N-carboxyanhydride). This yields the block-copolymer 3.

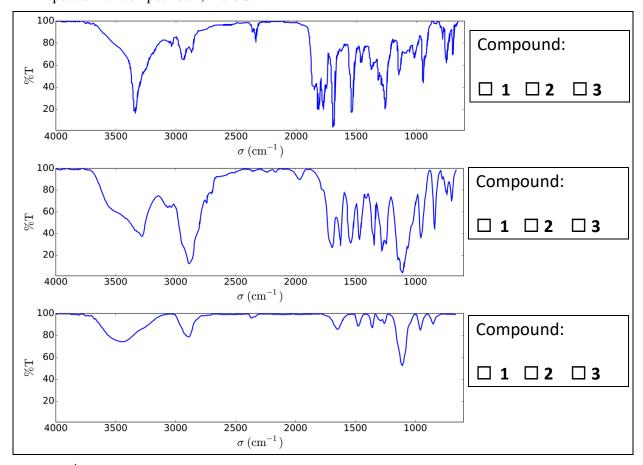

$$\mathbf{2}: C_{15}H_{18}N_2O_5, 306.3 \text{ g mol}^{-1}$$

$$\mathbf{Cbz}$$

3. <u>Draw</u> the reaction intermediate formed in the first step of the addition of 1 to 2. The second step of the mechanism leads to the formation of a gas molecule, G. <u>Draw</u> its structure.

**G**:

4. Infrared (IR) measurements are performed to characterize the compounds. <u>Match</u> the three IR spectra with compounds 1, 2 and 3.

5. The <sup>1</sup>H NMR spectrum of copolymer **3** (in DMSO- $d_6$ , at 60 °C, 500 MHz) is reported in Fig. 1. Using some or all of the NMR signals (areas Table 2), **calculate** its number average molar mass  $M_n$ , considering n from question 2. For your calculations, **draw** a circle around the group(s) of atoms you used and **give** their corresponding symbol(s)  $(\alpha, \beta...)$ .

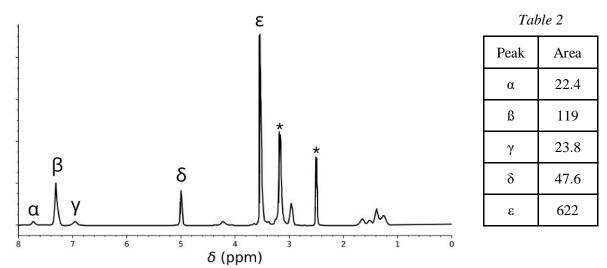

Fig. 1 – signals marked with \* correspond to the solvent and water.

$$H = \begin{pmatrix} 0 \\ N \\ H \end{pmatrix}_{m} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

 $M_{\rm n} = {
m kg mol^{-1}}$  Provide your answer to two decimal places.

This reaction of  $\bf 1$  with  $\bf 2$  yielded the copolymers  $\bf 3a$  after 20 h,  $\bf 3b$  after 25 h and  $\bf 3c$  after 30 h of reaction at 40 °C. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

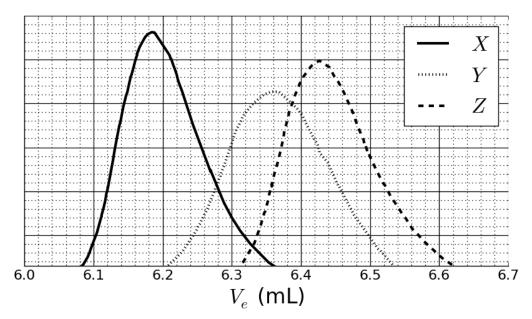

Fig. 2 – SEC chromatograms of 3a, 3b and 3c as a function of the elution volume,  $V_e$ .

6. Match the signals in Fig. 2 with the copolymers 3a, 3b and 3c.

3a:	$\square X$	$\square Y$	$\square Z$
3a: 3b: 3c:	$\square X$	$\square Y$	$\square Z$
3c:	$\square X$	$\square Y$	$\square Z$

In order to calibrate the chromatogram, a mixture of standard polymers of known masses (3, 30, 130, 700 and 7000 kg mol<sup>-1</sup>) has been studied (Fig. 3).

The log value of the molar mass is a linear function of the elution volume, Ve.

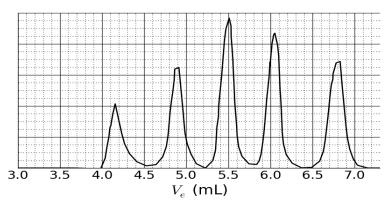

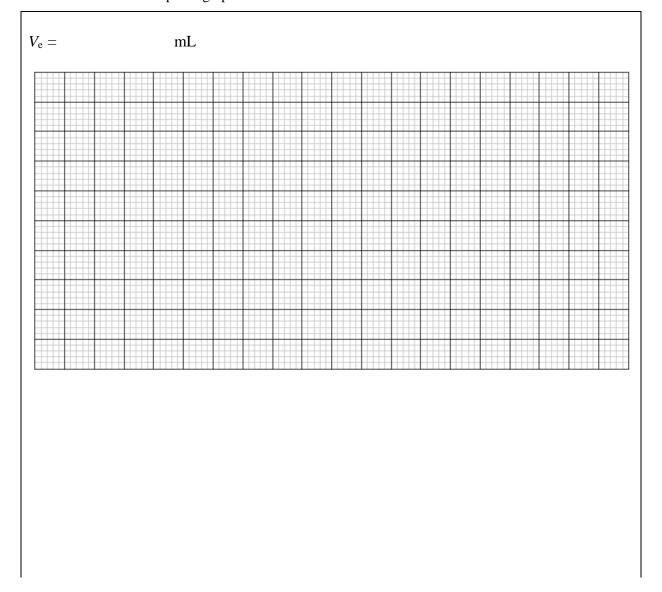

Fig. 3 – SEC chromatogram of the mixture of standards.

7. Based on the SEC curves in Fig. 2 and 3, <u>determine</u>  $V_e$  of polymer resulting in curve X and use it to <u>estimate</u> the degree of polymerization m of its second block. <u>Detail</u> your calculation; you may use a calculator or plot a graph.

Keep going. You are almost there  $\ \odot$  .

### **Triblock copolymer synthesis**

For biological applications, involving the formation of micelles, a triblock copolymer 9 can be synthesized through the introduction of a middle block, **B**, using monomer 5.

8. **Draw** the structures of **5**, **7** and **8**.

5 (no products other than 6:A-B are obtained)

7 (a gas is formed in the final step)

8

9. Amphiphilic block copolymers, such as **9: A-B-C**, can be used for medical applications, as they self-assemble into micelles in water (pH = 7). These can be used as drug carriers. **Assign** each block of the copolymer to a property. **Draw** a scheme of the micelle with only 4 polymer chains.

## Problem T7: Ring motion in a [2]catenane

Problem	Question	1	2	3	4	5	6	7	8	9	10	11	Total
<b>T7</b>	Points	4	12	2	2	2	5	5	8	4	5	5	54
6%	Score												

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa *"for the design and synthesis of molecular machines"*. An example of these is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper (+I or +II), two configurations are obtained (Fig. 1).

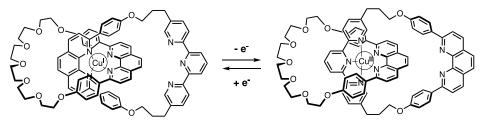

Fig. 1 – Multi-stability of a ring in a [2] catenane.

The synthesis of the macrocycle is given below:

1. **<u>Draw</u>** the structure of **B**.

В			

2.	<u>Draw</u> structures of <b>E</b> , <b>F</b> and <b>G</b> .
E	
F	
G	
3.	Out of the following reagents, <b>choose</b> one(s) which can produce <b>E</b> from <b>D</b> :
	$H^+$ , $H_2O$ $OH^-$ , $H_2O$
	NaBH <sub>4</sub> , CH <sub>3</sub> OH
	H <sub>2</sub> , Pd/C, THF
4.	In the synthetic strategy, MsCl is used to obtain:
	a leaving group a protecting group
	a deactivating group
	a directing group
5.	<b>G</b> is obtained by reacting <b>F</b> with LiBr in acetone. This reaction is:
	an electrophilic aromatic substitution a nucleophilic aromatic substitution
	S <sub>N</sub> 1 S <sub>N</sub> 2
	ANI /

6. <u>Draw</u> the transition state of the rate-determining step for reaction  $\mathbf{F} \to \mathbf{G}$ , showing 3D geometry. Depict only one reaction center. The main carbon chain can be represented as an R group.

Transition state:		

The synthesis of [2] catenane  ${\bf L}$  uses the template effect of a copper complex:

7. <u>Write</u> the full electron configuration of Cu(0) in its ground state. Give the oxidation state of Cu in complex **J**. Write the electron configuration of Cu in the free ion corresponding to **J**.

Electronic configuration of Cu(0):	
Oxidation state of Cu in <b>J</b> :	
Electronic configuration of Cu in <b>J</b> :	

8. **Select** the geometry of the copper ion in **L**. Assuming an ideal geometry of ligands around the copper center, **draw** the electronic levels of the d orbitals subject to the crystal field. **Fill** the orbital diagram. **Give** the maximum value of the spin (S) for this complex.

The geometry of Cu in <b>L</b> is:
☐ Octahedral
☐ Tetrahedral
☐ Square planar
☐ Trigonal bipyramid
Splitting and filling of d orbitals:
S =
S –

9. Choose the compound(s) that can remove the copper ion in L to give the free [2] catenane:

In [2]catenane **L**, the copper ion can exist in two oxidation states (+I) or (+II). Each of these has a different coordination sphere (tetra- or penta-coordinated, respectively).

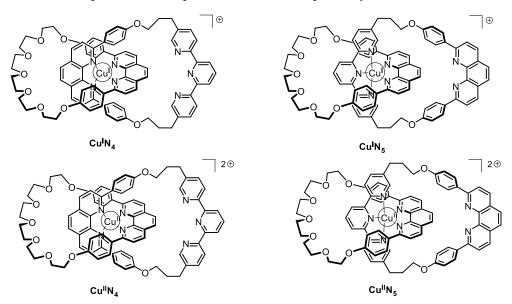

Fig. 2-[2] catenane L states

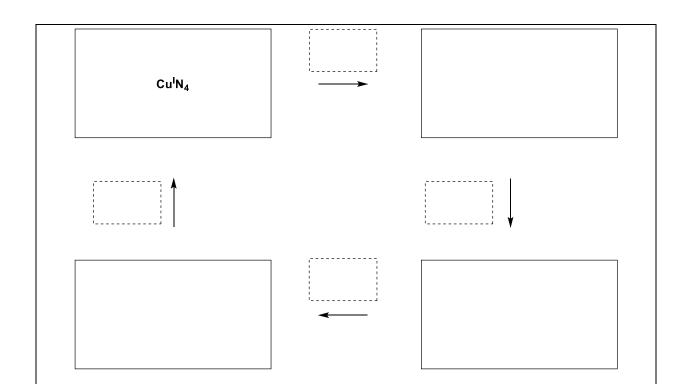

The stability of Cu(I) complexes can be inferred by comparing their electronic structures to that of a noble gas.

10. **Fill** in the blanks with a number or a tick:

The Cu <sup>I</sup> N <sub>4</sub> complex has	electrons in the coordination sphere of the metal.				
The $Cu^IN_5$ complex has	electrons in the coordination sphere of the metal.				
The $Cu^IN_4$ complex is $\square$ more / $\square$ less stable than the $Cu^IN_5$ complex.					

11. <u>Fill</u> in the solid boxes with the designation complexes in Fig. 2.

<u>Complete</u> the sequence to achieve electrochemical control of the system using the following notation for the dashed boxes:  $-e^-$

# **Problem T8: Identification and synthesis of inositols**

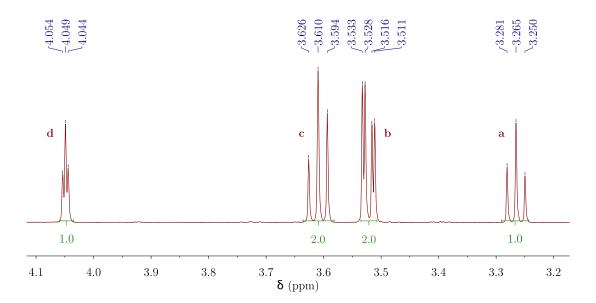

In this problem, we define "3D structure" and "perspective formula" as shown for  $\beta$ -glucose below.

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular *myo*-inositol, are involved in a number of biological processes.

### Structure of myo-inositol

1. <u>Draw</u> the structural formula of inositol, without stereochemical details.
This family of molecules contains 9 different stereoisomers, including enantiomers.
2. <u>Draw</u> all 3D structures of stereoisomers that are optically active.

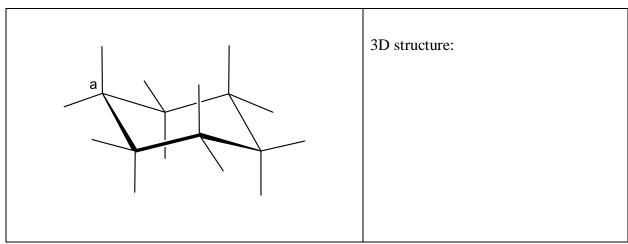

The structure of a specific inositol, called *myo*-inositol, is studied here. Only one of its chair conformers is predominant, and its structure can be deduced from its <sup>1</sup>H NMR spectrum. The spectrum below was obtained at 600 MHz in D<sub>2</sub>O. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. <u>Give</u> the molecular formula of the predominant compound derived from *myo*-inositol in this sample that is consistent with the number of protons observed in the <sup>1</sup>H NMR spectrum.

4. Based on the number and integrations of the proton signals, **give** the number of symmetry plane(s) in this molecule.

5. <u>Complete</u> the following perspective drawing of the most stable conformation of *myo*-inositol. Then <u>label</u> each hydrogen with the letter (**a**, **b**, **c** or **d**) according to the NMR spectrum above. Proton **a** must be on carbon **a** shown below. <u>Draw</u> the 3D structure of *myo*-inositol.

### Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. <u>Choose</u> the correct structural relationship(s) between 2 and 3.

Inositol 2 can be obtained from compound 1 in 7 steps.

7.	<u>Draw</u> the 3D structure of 4.	
4		
8.	-	bond with the highest electron density. Consider 1-ture of <b>4</b> . <u>Circle</u> the double bond with the highest effect of the bromine on a separate structure.
	Br	
9.	<u>Draw</u> the 3D structure of the major diastereom	er <b>5</b> .
5		
10	. <u>Give</u> the total number of stereoisomers of 5 that enantiopure compound 1.	at could be obtained by this synthesis, starting from
11	For the step $5 \rightarrow 6$ , another product with the same $\underline{\mathbf{Draw}}$ 3D structures of $6$ and $6$ .	me molecular formula, denoted 6', can be produced
6		6'

12.	. <u>Draw</u> the 3D structures of major diastereomers 8 and 9.				
8		9			
13.	Select reagent A to obtain 2 from 9.				
	H <sub>2</sub> , Pd/C K <sub>2</sub> CO <sub>3</sub> , HF HCOOH, H <sub>2</sub> O BF <sub>3</sub> ·OEt <sub>2</sub>				
14.	If the bromine is not present in compound 1, and to 2. <u>Draw</u> the 3D structure of this stereoisomer in the synthesis is the same, and the same number <u>Choose</u> the relationship of this stereoisomer with	, presuming the stereoselectivity of the reactions er of equivalents of reagents are used.			
	enantiomer epimer				
	diastereoisomer atropoisomer				
15.	During the synthesis of 2 from 1, choose the step	o(s) for removal of <u>protecting</u> or <u>directing</u> groups.			
	$ \begin{array}{c} 1 \to 4 \\ 4 \to 5 \end{array} $				
	$ 5 \to 6 \\ 6 \to 7 \\ 7 $

## **Problem T9: Synthesis of levobupivacaine**

#### Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

L-Lysine hydrochloride

1. <u>Assign</u> the absolute configuration of the stereogenic center in L-lysine, and <u>justify</u> your answer by classifying the substituents in order of their priority.

Configuration:	Priority $1 > 2 > 3 > 4$ :
$\square R$	$NH_3^+_{Cl}^ NH_3^+$ $COO^ H$

2. The prefix L in L-lysine refers to relative configuration. **Choose** all correct statements:

- ☐ All natural L-amino acids are levorotatory.
- ☐ Natural L-amino acids can be levorotatory or dextrorotatory.
- $\square$  All natural L-amino acids are (S).
- $\square$  All natural L-amino acids are (R).

Often, we want only one amino groups in L-lysine to react. A  $Cu^{2+}$  salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed  $NH_2$  group is available to react.

3. Considering that L-lysine acts as a bidentate ligand and that two molecules of L-lysine coordinate to one Cu<sup>2+</sup> ion in the presence of aqueous hydroxide, <u>draw</u> the structure of the intermediate complex.

Complex	l
	l
	l
	l
	l
	l
	l
	l
	1

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without  $Cu^{2+}$  salt.

$$\begin{array}{c} \text{Cl}_{+} \\ \text{H}_{3} \\ \text{N} \\ \text{L-Lysine} \\ \text{hydrochloride} \\ \end{array} \begin{array}{c} \text{1) 1 eq. LiOH} \\ \text{2) 1 eq. From this point on, you can use the abbreviations proposed in the scheme above.

4. <u>Draw</u> the structure of compound A, including the appropriate stereochemistry.

A		

5. Transformation of L-lysine into **A** is (**choose** proper answer(s)):

- □ an enantioselective reaction.
  □ an enantiospecific reaction.
  □ a regioselective reaction.
  - 6.  $\underline{\mathbf{Draw}}$  the structures of compounds  $\mathbf{B}-\mathbf{F}$ , including the appropriate stereochemistry.

<b>B</b> C <sub>14</sub> H <sub>20</sub> N <sub>2</sub> O <sub>4</sub>	C C <sub>16</sub> H <sub>21</sub> NO <sub>6</sub>					
D	E C <sub>29</sub> H <sub>34</sub> N <sub>2</sub> O <sub>6</sub> S					
$\mathbf{F}  \mathbf{C}_{21} \mathbf{H}_{28} \mathbf{N}_2 \mathbf{O}_4 \mathbf{S}$						
7. What is the role of DCC in the transformation	$C \to \mathbf{D}$ ?					
Protecting group for the amino group. Protecting group for the hydroxy group. Activating agent for the amide bond formation.						
8. TsCl is used in the synthesis to enable:	TsCl is used in the synthesis to enable:					
Nucleophilic substitution of an amino group.  Electrophilic substitution of an amino group.  Nucleophilic substitution of a hydroxy group.  Electrophilic substitution of a hydroxy group.						

9. Mark all possible reagents which could be used as reagent H:

☐ diluted HCl	□ Zn/HCl
$\square$ K <sub>2</sub> CO <sub>3</sub>	$\square$ H <sub>2</sub> SO <sub>4</sub>
☐ diluted KMnO <sub>4</sub> ☐ SOCl <sub>2</sub>	☐ diluted NaOH ☐ PCl <sub>5</sub>
10. <u>Draw</u> the structure of levobupivacaine, including the appropriate stereochemistry.	
Levobupivacaine C <sub>18</sub> H <sub>28</sub> N <sub>2</sub> O	
Part II.	
The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of aminoacids is their transformation into amides using Mosher's acid (see the structure of the ( <i>S</i> ) isomer below).	
_0 <u>_0</u>	F <sub>3</sub>
HO	
0	
(S)-Moshe	r's acid
11. <u>Draw</u> the structure of the amide formed when the α-amino group of L-lysine is derivatized with ( <i>S</i> )-Mosher's acid. Clearly show the stereochemistry of each stereogenic centre.	
12. <u>How many products</u> will be formed from racemic lysine and (S)-Mosher's acid? Consider that only the α-amino group of lysine is derivatized.	
☐ Two diastereoisomers.	
Four diastereoisomers.
