## THEORETICAL EXAM

# $\mathbf{I}^{\top} \mathbf{C}^{\top} \mathbf{h} \mathbf{0}$ <br> 51st - International Chemistry Olympiad France - Paris - 2019 

Making science together!
2019-07-26

## General instructions

- This theoretical exam booklet contains 62 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designated areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it. (test soraglarynda ýalňys jogabyňyzy düzedeniňizde ýalňyş gutyny doly garalaň we deregine täze boş guty ýasan̆)
- The supervisor will announce a 30 -minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by $1 / 2$ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, and wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

## GOOD LUCK!

## Table of Contents

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

Problem T1: Infinite well and butadiene
Problem T2: Hydrogen production by water-splitting
Problem T3: About silver chloride

Problem T4: From black powder to the discovery of iodine
Problem T5: Complexes for the formation of nanomachines
Problem T6: Characterization of a block-copolymer

Problem T7: Ring motion in a [2]catenane
Problem T8: Identification and synthesis of inositols
Problem T9: Synthesis of levobupivacaine
(6\%)
p. 8
(7\%)
(5\%)
p. 19
p. 24
(8\%)
p. 30
(8\%)
p. 39
(6\%)
p. 47
(6\%)
p. 52
(7\%)
p. 57

## Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in $\mathrm{mol} \mathrm{L}^{-1}$. To further simplify formulas and expressions, the standard concentration $c^{\circ}=1 \mathrm{~mol} \mathrm{~L}^{-1}$ is omitted.

Avogadro's constant:
Universal gas constant:
Standard pressure:
Atmospheric pressure:
Zero of the Celsius scale:
Faraday constant:
Watt:
Kilowatt hour:
Planck constant:
Speed of light in vacuum:
Elementary charge:
Electron-volt
Electrical power:
Power efficiency:
Planck-Einstein relation:
Ideal gas equation:
Gibbs free energy:

Reaction quotient $Q$ for a reaction
$a \mathrm{~A}(\mathrm{aq})+b \mathrm{~B}(\mathrm{aq})=c \mathrm{C}(\mathrm{aq})+d \mathrm{D}(\mathrm{aq}):$
Henderson-Hasselbalch equation:
Nernst-Peterson equation:
where $Q$ is the reaction quotient of the reduction half-reaction
Beer-Lambert law:
Rate laws in integrated form:

- Zero order:
- First order:
- Second order:

Half-life for a first order process:

Number average molar mass $M_{\mathrm{n}}$ :
Mass average molar mass $M_{\mathrm{w}}$ :
Polydispersity index $I_{\mathrm{p}}$ :

## Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written $\mathrm{CH}_{2}=\mathrm{CH}-\mathrm{CH}=\mathrm{CH}_{2}$, with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the $\pi$ electrons are better described by a distribution along the three bonds:

This system can be modeled as a 1D box (i.e. infinite potential well) where the electrons are free. The energy of an electron in an infinite well of length $L$ is: $E_{n}=\frac{n^{2} h^{2}}{8 m_{e} L^{2}}$, where $n$ is a non-zero positive integer.

1. Two different models are studied. Sketch at least the three lowest-energy levels $E_{\mathrm{n}}$ for each model in the respective diagrams, showing how the relative energy levels differ within and between models. (görräli energiýa gatlaklar- her modeliň öz içinde we iki modeliň arasynda nähili tapawutlanýandygyny çyzanyňyzda görkezin̆)

Model 1 («localized»): The $\pi$ electrons are localized in isolated bonds and reside(ýerleşýär) in two separate infinite potential wells of length $d$.

Model 2 («delocalized»): The $\pi$ electrons are delocalized in the whole molecule and reside in a single infinite potential well of length $3 d$.
2. Place the $\pi$ electrons for model 1 in the previous diagram and express (an̆ladyn̆) the total energy of the $\pi$ system in model 1 , as a function of $h, m_{\mathrm{e}}$ and $d$.
$E(1)=$
3. Place the $\pi$ electrons for model 2 in the previous diagram and express the total energy of the $\pi$ system in model 2 , as a function of $h, m_{\mathrm{e}}$ and $d$.
$E(2)=$

The conjugation energy is the total energy of the conjugated $\pi$ system minus the sum of the energies of ethylene molecules with the same number of electrons.
4. Express the conjugation energy $\Delta E_{\mathrm{c}}$ of butadiene, as a function of $h, m_{\mathrm{e}}$ and $d$.

$$
\Delta E_{\mathrm{c}}=
$$

Models 1 and 2 are too simplistic(has ý̈̈nekey). A new model will be detailed in the following:
5. Draw three other resonance structures of butadiene using Lewis notations.

| $\mathrm{H}_{2} \mathrm{C} \sim$ |
| :--- | :--- | :--- | :--- |

To take into account the size of carbon atoms, model 2 was modified into model 3 , as follows:

- the new length of the well is $L$ and is located between the abscissa( $x$ okynda) 0 and $L$;
- the carbon atoms are located at the abscissas $L / 8 ; 3 L / 8 ; 5 L / 8$ and $7 L / 8$.

For each level $n$, the $\pi$ wavefunction is:

$$
\psi_{\mathrm{n}}(x)=\sqrt{\frac{2}{L}} \sin \left(\frac{n \pi x}{L}\right)
$$

and the $\pi$ electron density for a system with $N \pi$ electrons is:

$$
\rho(x)=2 \sum_{i=1}^{N / 2}\left|\psi_{i}(x)\right|^{2}
$$

The four $\pi$ wavefunctions, which correspond to the molecular orbitals of the $\pi$ system, are depicted below (arbitrary order- tertipsiz berlen).

6. Rank the energies of the four $\pi$ wavefunctions ( $E_{\mathrm{A}}, E_{\mathrm{B}}, E_{\mathrm{C}}$ and $E_{\mathrm{D}}$ ).
$\square$
7. Identify the labels ( $\mathrm{A}, \mathrm{B}, \mathrm{C}$ or D ) of the orbitals that are filled with electrons(elektronlar bilen dolan orbitallar) in butadiene.
8. According to model 3 , determine the values of the $\pi$ wavefunctions $\psi_{\mathrm{n}}$ for occupied levels at positions $0, L / 4$ and $L / 2$, for $n=1$ and $n=2$, as a function of $L$. ( $n=1$ we $n=2$ bahalar üçin 0,L/4,L/2 pozisiýalarda $\psi_{n}$ bahalaryny L-e görä an̆ladyn̆)

$$
\psi_{1}(0)=
$$

$\psi_{1}\left(\frac{L}{4}\right)=$
$\psi_{1}\left(\frac{L}{2}\right)=$
$\psi_{2}(0)=$
$\psi_{2}\left(\frac{L}{4}\right)=$
$\psi_{2}\left(\frac{L}{2}\right)=$
9. According to model 3 , determine the values of the $\pi$ electron density at positions $0, L / 4$ and $L / 2$.

$$
\rho(0)=
$$

$\rho\left(\frac{L}{4}\right)=$
$\rho\left(\frac{L}{2}\right)=$
10. Draw the $\pi$ electron density between 0 and $L$.

11. Rank the following CC bond lengths (B1, B2, ..., B5) from shortest to longest, using the symbols $=$ or $<$.

B1: $\quad \mathrm{C} 1 \mathrm{C} 2$ in the butadiene molecule
B2 : $\quad \mathrm{C} 2 \mathrm{C} 3$ in the butadiene molecule
B3: $\quad \mathrm{C} 3 \mathrm{C} 4$ in the butadiene molecule
B4: $\quad \mathrm{CC}$ in the ethane molecule
B5: $\quad \mathrm{CC}$ in the ethene molecule

## Problem T2: Hydrogen production by water-splitting

## Data:

| Compound | $\mathrm{H}_{2}(\mathrm{~g})$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | $\mathrm{O}_{2}(\mathrm{~g})$ |
| :--- | :---: | :---: | :---: | :---: |
| $\Delta_{\mathrm{f}} H^{\circ}\left(\mathrm{kJ} \mathrm{mol}^{-1}\right)$ | 0 | -285.8 | -241.8 | 0 |
| $S_{\mathrm{m}}{ }^{\circ}\left(\mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)$ | 130.6 | 69.9 | 188.7 | 205.2 |

Molecular hydrogen $\left(\mathrm{H}_{2}\right)$ can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1. Write the balanced equation of the liquid water splitting reaction(dargama reaksiýasy) using a stoichiometric coefficient of 1 for water.
2. Using only the thermodynamic data provided above, justify numerically (hasaplap subut et) whether this reaction is thermodynamically favorable at 298 K .

## Calculations:

Reaction thermodynamically favorable?

Yes

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected to a power supply (Fig. 1). Gas bubbles are formed at both electrodes.

Fig. 1 - Water-splitting electrochemical cell.
3. Write the balanced net electrochemical half reactions occurring at each electrode.

## On electrode (1):

## On electrode (2):

4. Using only the thermodynamic data provided above (or question 2), calculate (to three decimal places) $\Delta E_{\text {th }}$ necessary for the process. Check the appropriate box for the correct condition such that the reaction will be thermodynamically favorable at 298 K when all reactants and products are in their standard states.

Calculation:
$\Delta E_{\mathrm{th}}=$ $\qquad$ V (give the result with 3 decimal places;
jogabyňyzda nokatdan soň 3 san bolmaly)
$\square \quad \Delta E_{\text {applied }}=\Delta E_{\text {th }}$
$\square \Delta E_{\text {applied }}>\Delta E_{\text {th }}$
$\square \Delta E_{\text {applied }}<\Delta E_{\text {th }}$
If you could not calculate $\Delta E_{\mathrm{tb}}$, the value 1.200 V can be used in the rest of the problem.

Experimentally, a higher voltage is needed to split water. For a given Pt cathode, the minimum voltage necessary to observe water splitting, $\Delta E_{\min }$, depends on the nature of the anode as displayed in the table below:

| Anode | $\Delta E_{\text {min }}(\mathrm{V})$ |
| :---: | :---: |
| $\mathrm{IrO}_{x}$ | 1.6 |
| $\mathrm{NiO}_{x}$ | 1.7 |
| $\mathrm{CoO}_{x}$ | 1.7 |
| $\mathrm{Fe}_{2} \mathrm{O}_{3}$ | 1.9 |

The difference between $\Delta E_{\min }$ and $\Delta E_{\mathrm{th}}$ is the "loss" in the device. (iki potensialyň arasyndaky tapawut sistamadaky ýitgi sebäpli)
5. Give the expression of the device power efficiency $\eta_{\text {elec }}$ (fraction of the power used for water splitting) as a function of $\Delta E_{\mathrm{th}}$ and $\Delta E_{\text {min }}$. Assuming an identical current value $I$, calculate the water electrolysis power efficiency when a Pt cathode and a $\mathrm{Fe}_{2} \mathrm{O}_{3}$ anode are used. Select the most efficient anode from the table above.

$$
\eta_{\mathrm{elec}}=
$$

Power efficiency when a Pt and $\mathrm{Fe}_{2} \mathrm{O}_{3}$ electrodes are used:
$\eta_{\text {elec }}=$
\%

Most efficient anode:

If you could not calculate $\eta_{\text {elec }}$, the value $\eta_{\mathrm{elec}}=75 \%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

Fig. 2 - Activation conditions and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard Hydrogen Electrode

Fig. 3 - Left axis: Spectral distribution of the solar photon flux(akym) $\phi$. The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with smaller wavelength).
6. Estimate the fraction of the solar photon flux that can activate the following semiconductors: $\mathrm{TiO}_{2}$, CdS , Si. Explicitly(aýdyn̆) include the equations and units used for the computation(hasaplama).

Explanation / calculation:

|  | Approximate <br> fraction |
| :---: | :---: |
| $\mathrm{TiO}_{2}$ | $\%$ |
| CdS | $\%$ |
| Si | $\%$ |

The activation of the semi-conductor results in a modification of the surface potentials, so that it can be seen as two electrodes of different potentials.
7. Using the data in Fig 2, choose the semiconductor(s) from the following list that, once activated, can be used as the anode and cathode for the water-splitting reaction.

| $\square \mathrm{ZrO}_{2}$ | $\square \mathrm{ZnO}$ | $\square \mathrm{TiO}_{2}$ | $\square \mathrm{WO}_{3}$ |
| :--- | :--- | :--- | :--- |
| $\square \mathrm{CdS}$ | $\square \mathrm{Fe}_{2} \mathrm{O}_{3}$ | $\square \mathrm{CdSe}$ | $\square \mathrm{Si}$ |

8. Give the semiconductor that, used as both cathode and anode, is expected to be the most efficient for water splitting upon exposure to sunlight.

The evolution of $\mathrm{H}_{2}$ and $\mathrm{O}_{2}$ when a semiconductor is irradiated by simulated solar light at $T=25^{\circ} \mathrm{C}$ at $p_{\text {atm }}$ was recently studied. Using incident light with a power(urýan şöhläniň güúyí) of $P=1.0 \mathrm{~kW} \mathrm{~m}{ }^{-2}$ and a photoelectrode with a $S=16 \mathrm{~mm}^{2}$ surface area, the volume of $\mathrm{H}_{2}(\mathrm{~g})$ produced after $\Delta t=1$ hour of exposure was $V=0.37 \mathrm{~cm}^{3}$.
9. Calculate the power efficiency $\eta_{\text {direct }}$ of the conversion.

```
Calculation:
\eta}\mp@subsup{|}{\mathrm{ direct }}{}
    %
If you could not calculate }\mp@subsup{\eta}{\mathrm{ direct,}}{}\mathrm{ the value }\mp@subsup{\eta}{\mathrm{ direct }}{}=10
    can be used in the rest of the problem.
```

Two modes of converting solar energy to hydrogen can thus be compared: direct photocatalysis, and indirect photo-electrolysis combining a photovoltaic panel with an electrolyzer. The efficiency of photovoltaic panels on the market is around $\eta_{\text {panels }}=20 \%$.
10. Compare the power efficiencies of the two modes, $\eta_{\text {direct }}$ and $\eta_{\text {indirect }}$, using $\mathrm{Fe}_{2} \mathrm{O}_{3}$ and Pt electrodes for the electrolysis.

Calculation:

## Problem T3: About silver chloride

## Data at 298 K:

$\mathrm{p} K_{\mathrm{s} 1}(\mathrm{AgCl})=9.7 ; \mathrm{p}_{\mathrm{s} 2}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=12$
Formation constant of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}: \beta_{\mathrm{n}}=10^{7.2}$
Potentials against the standard hydrogen electrode:
Standard potential of $\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s}): E^{\circ}\left(\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s})\right)=0.80 \mathrm{~V}$
Apparent potential of $\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{OH}^{-}(\mathrm{aq})$ (in seawater): $E^{\prime}\left(\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{OH}^{-}(\mathrm{aq})\right)=0.75 \mathrm{~V}$

## Part A: Quotes(bellikler) from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778-1850) deal(baglanysykly) with some properties of silver chloride.

Quote A: "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."
Quote B: "This salt has no taste since it is insoluble."
Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."
Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."
Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."
Quote F: "If you take a bowl(şakäse) made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

1. Quote A: Write the balanced chemical equation of $\mathrm{AgCl}(\mathrm{s})$ synthesis.
2. Quote B: Calculate the solubility $s$ of $\mathrm{AgCl}(\mathrm{s})$ in water at 298 K in $\mathrm{mol} \mathrm{L}^{-1}$.

Calculation:

$$
s=
$$

$\operatorname{mol} \mathrm{L}^{-1}$
3. Quote C: In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry $1: 2$ is formed. On the following qualitative axis (with pCl increasing from left to right), place on each dotted line the dominant silver-containing species. pCl values at frontiers are not expected. ( $p \mathrm{Cl}$ bahalaryny ýazmak gerek däl)

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry $n$ is formed.
4. Write the balanced equation corresponding to the synthesis of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}$from silver chloride and calculate the corresponding equilibrium constant.

## Equation:

Calculation:

$$
K=
$$

If you could not calculate $K$, the following value can be used in the rest of the problem: $K=10^{-3}$
5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain(bölejik) of solid disappears. At this moment, $\left[\mathrm{NH}_{3}\right]=1.78 \mathrm{~mol} \mathrm{~L}^{-1}$. Determine the stoichiometry of the complex neglecting dilution effects.

Calculation:

$$
n=
$$

6. Write the balanced chemical equation corresponding to quote $\mathbf{E}(\boldsymbol{b e l l i k} \boldsymbol{E})$.
7. Assuming that seawater is slightly basic and rich in dioxygen $\left(\mathrm{O}_{2}\right)$, and that silver metal can reduce dioxygen in such conditions, write a balanced chemical equation corresponding to the formation of the solid mentioned in quote F. A stoichiometric coefficient of 1 will be chosen for dioxygen. Calculate its equilibrium constant $K$ at 298 K .

## Equation:

Calculation:

$$
K=
$$

## Part B: The Mohr method

The Mohr method is based on the colorimetric titration of $\mathrm{Cl}^{-}$by $\mathrm{Ag}^{+}$in the presence of potassium chromate $\left(2 \mathrm{~K}^{+}, \mathrm{CrO}_{4}{ }^{2-}\right)$. Three drops ( $\sim 0.5 \mathrm{~mL}$ ) of a $\mathrm{K}_{2} \mathrm{CrO}_{4}$ solution at about $7.76 \cdot 10^{-3} \mathrm{~mol} \mathrm{~L}^{-1}$ are added to $\mathrm{V}_{0}=20.00 \mathrm{~mL}$ of a sodium chloride solution of unknown concentration $C_{\mathrm{C}}$. This solution is then titrated by silver nitrate $\left(\mathrm{Ag}^{+}, \mathrm{NO}_{3}{ }^{-}\right)$at $C_{\mathrm{Ag}}=0.050 \mathrm{~mol} \mathrm{~L}$-1 , which immediately (çaltlyk bilen) leads to the formation of solid $\mathbf{A}$. A red precipitate (solid $\mathbf{B}$ ) appears at $V_{\mathrm{Ag}}=4.30 \mathrm{~mL}$.
8. Write the balanced equations of the two reactions occurring during the experiment. Calculate the corresponding equilibrium constants.
$\square$
9. Identify the solids.

## Solid A:

Solid B:
10. Calculate the unknown concentration $C_{\mathrm{Cl}}$ of chloride ions in the sodium chloride solution.

Calculation:

$$
C_{\mathrm{Cl}}=\quad \mathrm{mol} \mathrm{~L}^{-1}
$$

If you could not calculate $C_{\mathrm{C}}$, the value $C_{\mathrm{Cl}}=0.010 \mathrm{~mol} L^{-1}$ can be used in the rest of the problem.
11. Calculate the minimal volume $V_{\mathrm{Ag}}(\mathrm{min})$ for which $\mathrm{AgCl}(\mathrm{s})$ precipitates.

Calculation:

12. Calculate the residual (galan) concentration $\left[\mathrm{Cl}^{-}\right]_{\text {res }}$ of chloride ions when silver chromate begins to precipitate. Justify why $\mathrm{CrO}_{4}{ }^{2-}$ is a good titration endpoint indicator by comparing the two values.

Calculation:

$$
\left[\mathrm{Cl}^{-}\right]_{\mathrm{res}}=
$$

$\mathrm{mol} \mathrm{L}^{-1}$
$\mathrm{CrO}_{4}{ }^{2-}$ is a good titration endpoint indicator because:

| 7\% | Score |  |  |  |  |  |  |  |  |  |

## Problem T4: From gunpowder to the discovery of iodine

In the $19^{\text {th }}$ century, French entrepreneur $B$. Courtois specialized in the production of nitrate $\mathbf{A}$ $\left(\mathbf{M}_{\mathbf{A}}\left(\mathrm{NO}_{3}\right)_{m}\right)$, used for gunpowder. Initially imported from Asia, $\mathbf{A}$ was later produced from nitrate $\mathbf{B}$ $\left(\mathbf{M}_{\mathbf{B}}\left(\mathrm{NO}_{3}\right)_{n}\right)$ using an exchange reaction with compound $\mathbf{C}$, obtained from algae(suw oty).

1. Determine the formulas of nitrates $\mathbf{A}$ and $\mathbf{B}$ knowing that they are anhydrous salts of alkaline or alkaline-earth metal ( $\mathbf{M}_{\mathbf{A}}$ and $\mathbf{M}_{\mathbf{B}}$ ). One of the nitrates contains no more than $1 \mathrm{w} \%$ of non-metallic impurities while the other contains $9 \pm 3 \mathrm{w} \%$ of impurities(nitratlaryň biri massasy boýunça $1 \%$ galyndy saklaýar; beýleki bolsa 6-12\% aralygynda galyndy saklap bilÿär). The content of metals $\mathbf{M}_{\mathbf{A}}$ and $\mathbf{M}_{\mathbf{B}}$ in the samples is $38.4 \mathrm{w} \%$ and $22.4 \mathrm{w} \%$ respectively. Support your answer with calculations.
$\square$

To obtain A, 262.2 g of solid compound $\mathbf{C}$ were added to the solution containing 442.8 g of $\mathbf{B} . \mathbf{B}$ is known to be in excess. As a result, 190.0 g of white precipitate $\mathbf{D}$ were formed and removed by filtration. The filtrate was evaporated, and solid mixture $\mathbf{E}$ was isolated and heated until the mass of the sample (containing only nitrites, $\mathrm{NO}_{2}^{-}$) was constant(alnan $\boldsymbol{E}$ gaty garyndy hemişelik massa çenli gyzdyryldy, diňe nitritleri saklaýan nusga alyndy). The only gaseous product was dioxygen: 60.48 L at $0^{\circ} \mathrm{C}$ and 1 atm (dioxygen can be considered as an ideal gas).
2. Calculate the composition (in w\%) of mixture $\mathbf{E}$ considering that it contained only compounds $\mathbf{A}$ and $\mathbf{B}$ and no other impurities, and that $\mathbf{C}$ was in its pure, anhydrous state-suwsyz yagdaýda.
3. Determine the formulas of compounds $\mathbf{C}$ and $\mathbf{D}$ and write the balanced equation for the reaction between $\mathbf{B}$ and $\mathbf{C}$.

C:
and $\mathbf{D}$ :

Reaction between $\mathbf{B}$ and $\mathbf{C}$ :

In 1811, when working with algae ashes, Courtois observed that copper containers wore out(bozulmak) faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled (dökmek) a solution of concentrated sulfuric acid on the dry algae ashes(suw oty küli). Violet(melewşe) vapors appeared instantly(derrew) ( $\mathbf{1}$, sulfuric acid is the oxidizing agent) and iodine ( $\mathbf{I}_{2}$ ) had just been discovered! Iodine was the cause of the copper corrosion(poslama) (2). However, because of the medicinal applications of iodine, Courtois opened a new facility to produce it by reacting algae with chlorine (3).
Nowadays, iodine is prepared from the following reactants: $\mathrm{NO}_{3}^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}(\mathbf{4})$ or $\mathrm{IO}_{3}{ }^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}(\mathbf{5})$.
4. Write balanced equations for reactions $\mathbf{1 - 5}$.

1

| 2 |
| :--- | :--- |
| 3 |
| $\mathbf{4}$ |
| $\mathbf{5}$ |

The solubility of iodine is very low in water, but significantly increases when iodide ions are added. Together they form ions such as triiodide, $\mathrm{I}_{3}{ }^{-}$:

$$
\begin{equation*}
\Gamma(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightleftharpoons \mathrm{I}_{3}^{-}(\mathrm{aq}) \tag{6}
\end{equation*}
$$

Equilibrium (6) can be studied through the extraction of $\mathrm{I}_{2}$ with dichloromethane. Indeed, $\mathrm{I}^{-}$and $\mathrm{I}_{3}{ }^{-}$do not dissolve in organic solvents but $\mathrm{I}_{2}$ does and, when extracted, (organiki eredijide $I, I_{3}{ }^{\cdot}$ eremeýär; emma $I_{2}$ ereýär) it is 15 times more concentrated in dichloromethane than in water.
To determine the solubility of $\mathrm{I}_{2}$ in dichloromethane, the following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide ( 0.1112 g ). Then, 50.0 mL of dichloromethane were added and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated by 16.20 mL (organic phase) and by 8.00 mL (aqueous phase) with a standardized aqueous solution of sodium thiosulphate pentahydrate ( 14.9080 g in 1.000 L of solution) (bäs suw saklaýan standart tiosulfat ergini -14.9080 gr, llitr suwdaky- bilen titirlendi) in the presence of starch. The process is schematically represented below:

CLess $=$ Colorless $\quad$ Dk $=$ dark
5. Match the the stages on the scheme (1-9) with the appropriate picture above (a-i).

| Stages | Picture |
| :---: | :---: |
| $\mathbf{1}$ |  |
| $\mathbf{2}$ |  |
| 3 |  |
| $\mathbf{4}$ |  |
| $\mathbf{5}$ |  |
| $\mathbf{6}$ |  |
| $\mathbf{7}$ |  |
| $\mathbf{8}$ |  |
| $\mathbf{9}$ |  |

6. Write balanced equations for the two possible chemical reactions in the aqueous phase during the titration that involve iodine-containing species and sodium thiosulphate.
7. Calculate the mass of iodine used to prepare the initial solution.

$$
m\left(\mathrm{I}_{2}\right)=
$$

$$
\mathrm{g}
$$

8. Calculate the equilibrium constant $K^{\circ}$ for equilibrium of reaction (6).
$\square$
$\square$

$$
K^{\circ}=
$$

## Problem T5: Azobenzene - $\beta$-cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of energy into nano-movement for applications such as drug delivery. Numerous nanomachines use light energy to isomerize azo compounds ( $\mathrm{R}-\mathrm{N}=\mathrm{N}-\mathrm{R}^{\prime}$ ).

1. Draw the stereoisomers of azobenzene $\left(\mathrm{H}_{5} \mathrm{C}_{6}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{5}\right)$ and draw a line between the two carbon atoms in each structure that are the furthest apart(iň das ýerleşen uglerodlaryň arasynda çyzyk çyz). Compare these two distances ( $d_{\text {trans }}$ and $d_{\text {cis }}$ ).
$\square$

Fig. 1 - Possible reactants for the synthesis of $\mathbf{M}$.
2. $\mathbf{M}$ can be synthesized in two steps from simple reactants (Fig. 1). Choose the reactants ( $\mathbf{N}$ to $\mathbf{Q}$ ) that can provide $\mathbf{M}$ with very high regioselectivity. Sodium nitrite $\left(\mathrm{NaNO}_{2}\right)$ in cold aqueous hydrochloric acid are used as reagents for the first step of the synthesis.

## Reactants: and

## Determination of the association constant $K_{t}$

$\beta$-cyclodextrin ( $\mathbf{C}$, Fig. 2) is a cyclic heptamer of glucose which can form inclusion(içinde ýerleşýän) complexes with azo compounds. In tasks 3 to 6 , using spectroscopy, we will determine the association (birleşme) constant $K_{\mathrm{t}}$, corresponding to the formation of the inclusion complex $\mathrm{CM}_{\text {trans }}$ as depicted in Fig. 2.

Fig. 2 - Formation of the $\mathbf{C M}_{\text {trans }}$ inclusion complex.

Several solutions were prepared by mixing $\mathbf{C}$ and $\mathbf{M}_{\text {trans }}$ in different proportions to reach initial concentrations $[\mathbf{C}]_{0}$ and $\left[\mathbf{M}_{\text {trans }}\right]_{0}$. While $\left[\mathbf{M}_{\text {trans }}\right]_{0}$ is identical for all solutions, $[\mathbf{C}]_{0}$ varies. ( $\boldsymbol{C}$ bilen $\boldsymbol{M}_{\text {trans }}$ birleşmelerini garyp dürli erginleri táýýarladylar: ol erginlerde [ $\left.\boldsymbol{M}_{\text {trans }}\right]_{o}$ bahasy hemmesi üçin birmeňzeş, diňe [C] bahasy tapawutlanýar) We followed, at a fixed wavelength, the change in absorbance, $\Delta A$, between the absorbance of each $\mathbf{C M}_{\text {trans }}$ solution and the pure $\mathbf{M}_{\text {trans }}$ solution. (taýýarlanan herbir erginiň siňdirijiligi bilen arassa $M_{\text {trans }}$ erginiň siňdirijiliginiň tapawudy $\Delta A$ bolýar ) The molar extinction coefficients of $\mathbf{C} \mathbf{M}_{\text {trans }}$ and $\mathbf{M}_{\text {trans }}$, are noted as $\varepsilon_{\mathrm{CMtrans}}$ and $\varepsilon_{\text {Mtrans }}$, respectively. $L$ is the path length. The absorbance of $\mathbf{C}\left(\varepsilon_{\mathrm{C}}\right)$ is negligible.
3. Prove mathematically that $\Delta A=\alpha \cdot\left[\mathbf{C M}_{\text {trans }}\right]$ and express $\alpha$ in terms of the constant(s) provided above.

Proof:

$$
\alpha=
$$

4. Prove that, when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}$ (i.e. $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}$ ), the concentration of $\mathbf{C}$ may be considered as constant, $[\mathbf{C}] \simeq[\mathbf{C}]_{0}$.

Proof:
5. Show that, when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}$ (i.e. $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}$ ), $\Delta A=\alpha \cdot \frac{\beta \cdot[\mathrm{C}]_{0}}{1+K_{\mathrm{t}} \cdot[\mathrm{C}]_{0}}$ and express $\beta$ in terms of constant(s) and initial concentration(s).

Proof:
$\square$
6. Determine $K_{\mathrm{t}}$ using the following experimental curve (Fig. 3).

Fig. 3 - Evolution of $1 / \Delta A$ as a function of $1 /[\boldsymbol{C}]_{0}$.

Calculations:

## Determination of the association constant $K_{\mathbf{c}}$

In tasks 7 to 9 , using kinetic studies, we will determine the association constant, $K_{\mathrm{c}}$, corresponding to the formation of the inclusion complex with $\mathbf{M}_{\text {cis }}, \mathbf{C M}_{\text {cis }}$. A sample containing only $\mathbf{M}_{\text {trans }}$ is irradiated and produces a known amount of $\mathbf{M}_{\mathbf{c i s}},\left[\mathbf{M}_{\mathbf{c i s}}\right]_{0} . \mathbf{M}_{\mathbf{c i s}}$ (free or within the inclusion complex) then thermally isomerizes into $\mathbf{M}_{\text {trans }}$. In the absence of $\mathbf{C}$, the isomerization follows first-order kinetics with a rate constant $k_{1}$. All complexation equilibria are faster than the isomerization process. The kinetic scheme corresponding to this experiment is provided in Fig. 4.

Fig. 4 - Kinetic scheme for the isomerization of $\boldsymbol{M}_{\text {cis }}$ in the presence of $\boldsymbol{C}$.

The rate of disappearance $r$ for the total amount of $\mathbf{M}_{\text {cis }}$ (free and complexed) is defined as

$$
r=k_{1}\left[\mathbf{M}_{\text {cis }}\right]+k_{2}\left[\mathbf{C} \mathbf{M}_{\text {cis }}\right]
$$

Experimentally, $r$ follows an apparent first order kinetic law with an apparent rate constant $k_{\text {obs }}$ :

$$
r=k_{\mathrm{obs}}\left(\left[\mathbf{M}_{\mathrm{cis}}\right]+\left[\mathbf{C M}_{\mathrm{cis}}\right]\right)
$$

7. Show that $k_{\mathrm{obs}}=\frac{\gamma+\delta \cdot k_{2}[\mathrm{C}]}{1+K_{\mathrm{c}}[\mathrm{C}]}$ and express $\gamma$ and $\delta$ in terms of known constant(s).

Proof:

8. Choose the condition(s) where the half-life $\left(t_{1 / 2}\right)$ corresponds to $k_{\mathrm{obs}}$ and prove mathematically that $t_{1 / 2}$ can be expressed as $t_{1 / 2}=\frac{\ln 2}{\gamma}\left(1+K_{\mathrm{c}}[\mathbf{C}]_{0}\right)$ given that $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {cis }}\right]_{0}$.
$\square \quad$ Very slow isomerization of $\mathbf{M}_{\text {cis }}$ within cyclodextrin
$\square \quad$ Very slow isomerization of free $\mathbf{M}_{\mathbf{c i s}}$
$\square \quad \mathbf{C M}_{\text {cis }}$ very stable
$\square \quad \mathbf{C M}_{\text {trans }}$ very stable

Proof:
9. Assuming the condition(s) in task 8 are satisfied, determine $K_{\mathrm{c}}$ by a linear regression using the data below. You may use a calculator or plot a graph.

| $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ | $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ |
| :---: | :---: | :---: | :---: |
| 0 | 3.0 | $3.0 \cdot 10^{-3}$ | 5.9 |
| $1.0 \cdot 10^{-4}$ | 3.2 | $5.0 \cdot 10^{-3}$ | 7.7 |
| $5.0 \cdot 10^{-4}$ | 3.6 | $7.5 \cdot 10^{-3}$ | 9.9 |
| $1.0 \cdot 10^{-3}$ | 4.1 | $1.0 \cdot 10^{-2}$ | 12.6 |

Equation of the linear regression:

$$
K_{\mathrm{c}}=
$$

## Formation of nanomachines

Fig. 5 - Cleavage(bölünmek) of an azobenzene-cyclodextrin inclusion complex induced(täsir etdirilmek) by a light-triggered(başlatmak) isomerization, which allows(netijelendirmek) delivery(dagamak) of a drug (grey sphere).

Another azobenzene compound (for which $K_{\mathrm{c}} \ll K_{\mathrm{t}}$ ), initially in the trans form, is covalently grafted on silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, grey circles in Fig. 5). Upon addition of $\mathbf{C}$, an inclusion complex is formed, which blocks the pores and prevents the release of the dye.
10. Choose the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of $\mathbf{C}$, and the dye can be released upon irradiation.

```
\square K
\square K
\square K
\square K
\square K
```

This azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that this azobenzene powder cannot move into solution. The powder is irradiated at a wavelength $\lambda_{1}$ to trigger(başlatmak) the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength $\lambda_{2}$.

Fig. 6 - Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line) and rhodamine B (dashed line).
11. Determine $\lambda_{1}$.
$\square$
12. Determine $\lambda_{2}$.
$\lambda_{2}=\quad \mathrm{nm}$

## Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble(öz-özünden birigip bilÿar). In this problem, the synthesis and characterization of such a macromolecule are studied.

## Study of the first block

In the first part, we will study the water soluble homopolymer $\mathbf{1}$ ( $\alpha$-methoxy- $\omega$ aminopolyethyleneglycol).

The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}\left(\mathrm{DMSO}-d_{6}, 60^{\circ} \mathrm{C}, 500 \mathrm{MHz}\right)$ includes the following signals:

| Index | $\boldsymbol{\delta}(\mathbf{p p m})$ | Peak Area |
| :---: | :---: | :---: |
| a | $2.7^{*}$ | 0.6 |
| b | 3.3 | 0.9 |
| c | 3.4 | 0.6 |
| d | $\sim 3.5$ | 133.7 |

Table 1, *in the presence of $D_{2} O$, the signal at 2.7 ppm disappears.

1. Match the ${ }^{1} \mathrm{H}$ NMR signals ( $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ ) from Table 1 with each of the corresponding protons.

2. Express the average degree of polymerization $n$ as a function of the area $A_{\mathrm{OC} 2 \mathrm{H} 4}$ of the NMR peak of the repeating unit and the area $A_{\mathrm{OCH} 3}$ of the NMR peak of the methyl end group. Calculate $n$.

Expression:

$$
n=
$$

If you could not calculate $n$, the value $n=100$ can be used in the rest of the problem.

## Study of a diblock-copolymer

The synthesis of the second block of the copolymer is performed through the reaction of $\mathbf{1}$ with $\mathbf{2}$ ( $\varepsilon$ -(benzyloxycarbonyl)-lysine $N$-carboxyanhydride). This yields the block-copolymer 3.

Cbz-

3. Draw the reaction intermediate that is formed in the first step of the addition of $\mathbf{1}$ to $\mathbf{2}$. The second step of the mechanism leads to the formation of a gas molecule, G. Draw the structure of gas $\mathbf{G}$.

Intermediate:
4. Infrared (IR) measurements were performed to characterize the compounds. Match the three IR spectra with compounds $\mathbf{1 , 2}$ and $\mathbf{3}$.

5. The ${ }^{1} \mathrm{H}$ NMR spectrum of copolymer 3 (in DMSO- $d_{6}$, at $60^{\circ} \mathrm{C}, 500 \mathrm{MHz}$ ) is reported in Fig. 1 . Using some or all of the NMR signals, the areas of which are reported in Table 2, calculate its average molar mass $M_{\mathrm{n}}$, considering $n$ from question 2 . Draw a circle around the group(s) of atoms you used in the calculation and label it with the corresponding symbol(s) ( $\alpha, \beta \ldots$ ).

Table 2

| Peak | Area |
| :---: | :---: |
| $\alpha$ | 22.4 |
| $\beta$ | 119 |
| $\gamma$ | 23.8 |
| $\delta$ | 47.6 |
| $\varepsilon$ | 622 |

Fig. 1 - signals marked with * correspond to the solvent and water.

This reaction of $\mathbf{1}$ with $\mathbf{2}$ yielded the copolymers $\mathbf{3 a}$ (after 20 h ), $\mathbf{3 b}$ (after 25 h ), and $\mathbf{3 c}$ (after 30 h ) at a temperature of $40^{\circ} \mathrm{C}$. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

Fig. 2 - SEC chromatograms of $\mathbf{3 a}, \mathbf{3 b}$ and $\mathbf{3 c}$ as a function of the elution volume, $V_{e}$.
6. Match the curves in Fig. 2 with the copolymers 3a, 3b and $\mathbf{3 c}$.

| 3a: | $\square X$ | $\square Y$ | $\square Z$ |
| :--- | :--- | :--- | :--- |
| 3b: | $\square X$ | $\square Y$ | $\square Z$ |
| 3c: | $\square X$ | $\square Y$ | $\square Z$ |

In order to calibrate the chromatogram, a mixture of standard polymers of known molar masses (3, 30, 130,700 and $7000 \mathrm{~kg} \mathrm{~mol}^{-1}$ ) were studied (Fig. 3).
The $\log$ value of the molar mass is a linear function of the elution volume, $V_{\mathrm{e}}$ :

Fig. 3 - SEC chromatogram of the mixture of standards.
7. Based on the SEC curves in Fig. 2 and 3, determine $V_{\mathrm{e}}$ of the polymer that corresponds to curve $X$ and use it to estimate the degree of polymerization $m$ of its second block. Detail your calculation; you may use a calculator or plot a graph.

| $V_{\mathrm{e}}=$ |
| :--- |
|  |
|  |

$m=$

## Triblock copolymer synthesis

For biological applications involving the formation of micelles, a triblock copolymer 9 can be synthesized through the introduction of a middle block, B, using monomer 5.

8. Draw the structures of $\mathbf{5}, \mathbf{7}$ and $\mathbf{8}$.

5 (the only product obtained is $\mathbf{6 : A - B}$ )

7 (you do not need to show the gas that is also formed in the third reaction of this sequence)

8
9. Amphiphilic block copolymers, such as 9: A-B-C, can be used for medical applications, because they self-assemble into micelles in water ( $\mathrm{pH}=7$ ), which can be used as drug carriers. Assign each block of the copolymer to a property. Draw a scheme of the micelle with only 4 polymer chains.

| A: | $\square$ hydrophobic | $\square$ hydrophilic |  |
| :--- | :--- | :--- | :--- |
| B: | $\square$ hydrophobic | $\square$ hydrophilic |  |
| C: | $\square$ hydrophobic | $\square$ hydrophilic |  |
|  |  | B |  |
|  |  |  |  |
|  |  |  |  |

## Problem T7: Ring motion in a [2]catenane

| Problem T7 | Question | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Points | 4 | 12 | 2 | 2 | 2 | 5 | 5 | 8 | 4 | 5 | 5 | 54 |
| 6\% | Score |  |  |  |  |  |  |  |  |  |  |  |  |

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper ( +I or +II ), two configurations are possible (Fig. 1).

Fig. 1 - Multi-stability of a ring in a [2]catenane.
The synthesis of the macrocycle is the following:

1. Draw the structure of $\mathbf{B}$.

B
2. Draw the structures of $\mathbf{E}, \mathbf{F}$ and $\mathbf{G}$.

| E |
| :--- | :--- |
|  |
| F |
|  |
| G |

3. Out of the following the reaction conditions, choose which one(s) can produce $\mathbf{E}$ from $\mathbf{D}$ :
$\square \mathrm{H}^{+}, \mathrm{H}_{2} \mathrm{O}$
$\square \mathrm{OH}^{-}, \mathrm{H}_{2} \mathrm{O}$
$\square \mathrm{NaBH}_{4}, \mathrm{CH}_{3} \mathrm{OH}$
$\square \mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{THF}$
4. Choose from the following to complete the sentence: In the synthetic strategy, MsCl is used to obtain $\qquad$ _.
$\square$ a leaving group
$\square$ a protecting group
$\square$ a deactivating group
$\square$ a directing group
5. $\mathbf{G}$ is obtained by the reaction between $\mathbf{F}$ and LiBr in acetone. This reaction is:
$\square$ electrophilic aromatic substitution
$\square$ nucleophilic aromatic substitution
$\square \mathrm{S}_{\mathrm{N}} 1$
$\square \mathrm{S}_{\mathrm{N}} 2$
6. Draw the transition state of the rate-determining step for the reaction $\mathbf{F} \rightarrow \mathbf{G}$, showing the 3D geometry. Depict (çyz) only one reaction center. The main carbon chain can be represented as an R group.

Transition state:

The synthesis of [2]catenane $\mathbf{L}$ uses the template effect of a copper complex:

I

L
7. Write the full electronic configuration of $\mathrm{Cu}(0)$ in its ground state. Give the oxidation state of Cu in complex $\mathbf{J}$ and write the electronic configuration of the $\mathbf{C u}$ ion in $\mathbf{J}$.

Electronic configuration of $\mathrm{Cu}(0)$ :

Oxidation state of Cu in $\mathbf{J}$ :

Electronic configuration of Cu in $\mathbf{J}$ :
8. Select the geometry of the copper ion in $\mathbf{L}$. Assuming an ideal geometry of the ligands around the copper center, draw the electronic levels of the d orbitals subject to the crystal field. Fill the orbital diagram. Give the maximum value of the spin $(S)$ for this complex.

The geometry of Cu in $\mathbf{L}$ is:
$\square$ Octahedral
$\square$ Tetrahedral
$\square$ Square planar
$\square$ Trigonal bipyramid

Splitting and filling of d orbitals:
$S=$
9. Out of the following compounds, choose the one(s) that can remove the copper ion in $\mathbf{L}$ to obtain the free [2]catenane:

| $\square$ | $\mathrm{CH}_{3} \mathrm{CN}$ |
| :--- | :--- | :--- |
| $\square$ | $\mathrm{NH}_{4} \mathrm{PF}_{6}$ |
| $\square \mathrm{KCN}$ |  |
| $\square$ tren |  |
|  |  |
| $\square$ |  |

In [2]catenane $\mathbf{L}$, the copper ion can exist in two oxidation states $(+\mathrm{I})$ or $(+\mathrm{II})$, and each of them exhibits(görkezýär) a different coordination sphere (tetra- or penta-coordinated, respectively).

$\mathrm{CuIN}_{4}$

Fig. 2 -[2]catenane $L$ states

The stability of $\mathrm{Cu}(\mathrm{I})$ complexes can be inferred by comparing their electronic structures to that of a noble gas.
10. Fill in the blanks with a number and check the appropriate box:

The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex has ___ electrons in the coordination sphere of the metal.
The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{5}$ complex has ___ electrons in the coordination sphere of the metal.
The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex is $\square$ more / $\square$ less stable than the $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{5}$ complex.
11. Write the appropriate complexes from Fig. 2 in the solid boxes. Fill in the dashed boxes with one of the following symbols: $\square$ (rotation); + $\mathrm{e}^{-} ;-\mathrm{e}^{-}$to illustrate(şekillendirilişi) the electrochemical changes in the system.

| Problem <br> T8 <br> $6 \%$ | Question | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | Total |

## Problem T8: Identification and synthesis of inositols

In this problem, we define " 3 D structure" and "perspective formula" as indicated for $\beta$-glucose in the following figure.

3D structure

perspective formula

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular myo-inositol, are involved in a number of biological processes.

## Structure of myo-inositol

1. Draw the structure of an inositol without stereochemistry.
$\square$
This family of molecules contains 9 different stereoisomers, including enantiomers.
2. Draw all 3D structures of the stereoisomers that are optically active.
$\square$

The structure of a specific inositol, called myo-inositol is studied here. Only one of its chair conformers is significant and the structure can be deduced from its ${ }^{1} \mathrm{H}$ NMR spectrum. The spectrum below was obtained at 600 MHz in $\mathrm{D}_{2} \mathrm{O}$. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. Give the molecular formula of the predominant compound (derived from myo-inositol) in this sample that is consistent with the number of protons observed in the ${ }^{1} \mathrm{H}$ NMR spectrum.
4. Based on the number and integrations of the proton signals, give the number of symmetry plane(s) that is(are) present in this molecule.
5. Complete the following perspective drawing of the most stable conformation of myo-inositol. Then label each hydrogen with the corresponding letter ( $\mathbf{a}, \mathbf{b}, \mathbf{c}$ or $\mathbf{d}$ ) according to the NMR spectrum above. Proton a must be on carbon a on the following representation. Draw its 3D structure.

## Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. Choose the correct structural relationship(s) between $\mathbf{2}$ and $\mathbf{3}$.

Inositol $\mathbf{2}$ can be obtained from compound $\mathbf{1}$ in 7 steps.

7. Draw the 3D structure of 4 .

4
8. The reaction leading to $\mathbf{5}$ occurs on the double bond with the highest electron density. Consider below the structure of 1 -bromo-1,3-cyclohexadiene, which is a portion of $\mathbf{4}$. Circle the double bond with the highest electron density. Draw separate structures to represent all of the electronic effects due to the bromine.

9. Draw the 3D structure of the major diastereomer 5 .

5
10. Give the total number of stereoisomers of $\mathbf{5}$ possibly obtained by this synthesis, starting from enantiopure compound $\mathbf{1}$.
11. For the step $\mathbf{5} \rightarrow \mathbf{6}$, another product with the same molecular formula, denoted $\mathbf{6}^{\prime}$, can be produced. Draw the 3D structures of $\mathbf{6}$ and $\mathbf{6}$.

| 6 | 6, |
| :--- | :--- |
|  |  |

12. Draw the 3D structures of major diastereomers $\mathbf{8}$ and $\mathbf{9}$.

| 8 | 9 |
| :--- | :--- |
|  |  |
|  |  |

13. Select the right set(s) of conditions labeled $\mathbf{A}$ to convert $\mathbf{9}$ to $\mathbf{2}$.
$\square \mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$
$\square \mathrm{K}_{2} \mathrm{CO}_{3}$, HF
$\square \mathrm{HCOOH}, \mathrm{H}_{2} \mathrm{O}$$\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$
14. If the bromine is not present in compound $\mathbf{1}$, in addition to $\mathbf{2}$, another stereoisomer would be obtained. If the stereoselectivity of the reactions in the synthesis remains unchanged and the steps involved use the same number of equivalents as for the preparation of $\mathbf{2}$, draw the 3D structure of this stereoisomer and select its relationship with 2.

## Structure:

$\square$ enantiomers
$\square$ epimers
$\square$ diastereoisomers
$\square$ atropoisomers
15. During the synthesis of $\mathbf{2}$ from $\mathbf{1}$, choose the $s t e p(s)$ that remove the protecting or directing groups.

```
\square \mp@code { 1 \rightarrow 4 }

## Problem T9: Synthesis of levobupivacaine

## Part $I$.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

1. Assign the absolute configuration of the stereogenic center in L-lysine hydrochloride and justify your answer by ranking the substituents in order of their priority.

| Configuration: | Priority $1>2>3>4$ : |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\square R$ |  | $\square$ | $\square$ | $\square$ | $\square$ |
| $\square S$ |  | $\square$ | $\square$ | $\square$ |  |

2. The prefix L in L-lysine refers to relative configuration. Choose all correct statements:All natural L-amino acids are levorotatory.Natural L-amino acids can be levorotatory or dextrorotatory.All natural L-amino acids are ( $S$ ).All natural L-amino acids are $(R)$.

Often, we want only one of the amino groups in L-lysine to react. $\mathrm{ACu}^{2+}$ salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed $\mathrm{NH}_{2}$ group is available to react.
3. If $\mathrm{L}-\mathrm{lysine}$ acts as a bidentate ligand and two $\mathrm{L}-\mathrm{lysin}$ es coordinate to one $\mathrm{Cu}^{2+}$ ion in the presence of aqueous hydroxide, draw the structure of the complex.

## Complex

Similarly, in the synthesis of levobupivacaine shown below, only one amino group reacts without the use of a $\mathrm{Cu}^{2+}$ salt.

$\mathrm{AcO}=\mathrm{CH}_{3} \mathrm{COO}$

G

(benzyloxycarbonyl chloride) ( $N, N$ '-dicyclohexylcarbodiimide) ( $p$-toluenesulfonyl chloride)

From this point on, you can use the abbreviations proposed in the scheme above.
4. Draw the structure of compound $\mathbf{A}$, including the appropriate stereochemistry.

## A

5. The transformation of L-lysine into $\mathbf{A}$ is (choose proper answer(s)):an enantioselective reaction.an enantiospecific reaction.
$\square$ a regioselective reaction.
6. Draw the structures of compounds $\mathbf{B}-\mathbf{F}$, including the appropriate stereochemistry.

| ${\text { B C }{ }_{14} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}}^{5}$ |  |
| :--- | :--- |
|  |  |
|  |  |
|  |  |
| D C C 16 |  |
|  |  |

7. Select the role of DCC in the transformation $\mathbf{C} \rightarrow \mathbf{D}$.
$\square$ Protecting group for the amino group.
$\square$ Protecting group for the hydroxy group.Activating agent for the amide bond formation.
8. Choose the appropriate phrase to complete the sentence: TsCl is used in the synthesis to enable
$\qquad$ .
$\square$ Nucleophilic substitution of an amino group.
$\square$ Electrophilic substitution of an amino group.
$\square$ Nucleophilic substitution of a hydroxy group.
$\square$ Electrophilic substitution of a hydroxy group.
9. Mark all possible reagents that could be used as $\mathbf{H}$ :

Draw the structure of levobupivacaine, including the appropriate stereochemistry.
Levobupivacaine $\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}$

## Part II.

The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of amino acids is their transformation into amides using Mosher's acid (see the structure of the ( $S$ ) isomer below).

(S)-Mosher's acid
10. Draw the structure of the amide formed when the $\alpha$-amino group of L-lysine is reacted with ( $S$ )Mosher's acid. Clearly show the stereochemistry of each chiral center.
11. Indicate how many products will be formed from racemic lysine and ( $S$ )-Mosher's acid (consider that only the $\alpha$-amino group of lysine is derivatized)?
$\square$ Two diastereoisomers.Four diastereoisomers.A racemic mixture of two enantiomers.
$\square$ Four compounds: two enantiomers and two diastereoisomers.
12. Choose the method(s) which can be used to quantitatively determine the enantiomeric purity of lysine after its derivatization with ( $S$ )-Mosher's acid:
$\square$ NMR spectroscopy.
$\square$ Liquid chromatography.
$\square$ Mass spectrometry.
$\square$ UV-vis spectroscopy.
