# THEORETICAL EXAM

51st — International Chemistry Olympiad France — Paris — 2019

Making science together!

2019-07-26

MINISTÈRE DE L'ÉDUCATION NATIONALE ET DE LA JEUNESSE

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR, DE LA RECHERCHE ET DE L'INNOVATION

#### **General instructions**

- This theoretical exam booklet contains 61 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designated areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30-minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by ½ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, and wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

#### **GOOD LUCK!**

### **Table of Contents**

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

Problem T1: Infinite well and butadiene	(6%)	p. 8
Problem T2: Hydrogen production by water-splitting	(7%)	p. 13
Problem T3: About silver chloride	(5%)	p. 19
Problem T4: From black powder to the discovery of iodine	(7%)	p. 24
Problem T5: Complexes for the formation of nanomachines	(8%)	p. 30
Problem T6: Characterization of a block-copolymer	(8%)	p. 39
Problem T7: Ring motion in a [2]catenane	(6%)	p. 47
Problem T8: Identification and synthesis of inositols	(6%)	p. 52
Problem T9: Synthesis of levobupivacaine	(7%)	p. 57

#### Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in mol  $L^{-1}$ . To further simplify formulas and expressions, the standard concentration  $c^{\circ} = 1 \text{ mol } L^{-1}$  is omitted.

Avogadro's constant:

#### Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written  $CH_2$ =CH-CH= $CH_2$ , with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the  $\pi$  electrons are better described by a distribution along the three bonds:

This system can be modeled as a 1D box (*i.e.* infinite potential well) where the electrons are free. The energy of an electron in an infinite well of length L is:  $E_n = \frac{n^2 h^2}{8m_e L^2}$ , where n is a **non-zero** positive integer.

1. Two different models are studied. <u>Sketch</u> at least the three lowest-energy levels  $E_n$  <u>for each</u> <u>model</u> in the respective diagrams, showing how the relative energy levels differ within and between models.

**Model 1** (« **localized** »): The  $\pi$  electrons are localized in isolated bonds and reside in two separate infinite potential wells of length d.

Model 2 (« delocalized »): The  $\pi$  electrons are delocalized in the whole molecule and reside in a single infinite potential well of length 3d.

2. Place the  $\pi$  electrons for model 1 in the previous diagram and express the total energy of the  $\pi$  system in model 1, as a function of h,  $m_e$  and d.

$$E(1) =$$

3. Place the  $\pi$  electrons for model 2 in the previous diagram and express the total energy of the  $\pi$  system in model 2, as a function of h,  $m_e$  and d.

$$E(2) =$$

The conjugation energy is the total energy of the conjugated  $\pi$  system minus the sum of the energies of ethylene molecules with the same number of electrons.

4. Express the conjugation energy  $\Delta E_c$  of butadiene, as a function of h,  $m_e$  and d.

$$\Delta E_{\rm c} =$$

Models 1 and 2 are too simplistic. A new model will be detailed in the following:

5. <u>Draw</u> three other resonance structures of butadiene using Lewis notations.

To take into account the size of carbon atoms, model 2 was modified into model 3, as follows:

- the new length of the well is L and is located between the abscissa 0 and L;
- the carbon atoms are located at the abscissas L/8; 3L/8; 5L/8 and 7L/8.

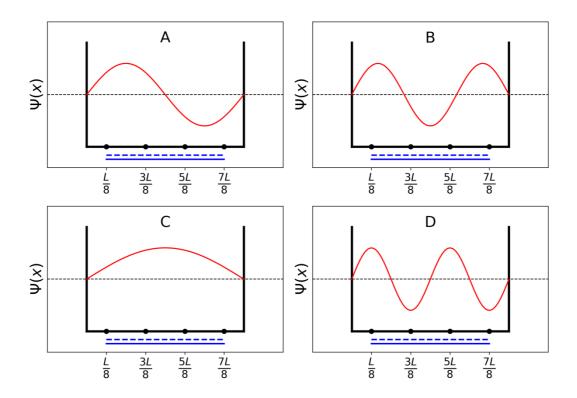

For each level n, the  $\pi$  wavefunction is:

$$\psi_{\rm n}(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$$

and the  $\pi$  electron density for a system with  $N \pi$  electrons is:

$$\rho(x) = 2 \sum_{i=1}^{N/2} |\psi_i(x)|^2$$

The four  $\pi$  wavefunctions, which correspond to the molecular orbitals of the  $\pi$  system, are depicted below (arbitrary order).

6. **Rank** the energies of the four  $\pi$  wavefunctions ( $E_A$ ,  $E_B$ ,  $E_C$  and  $E_D$ ).

< < <

7. <u>Identify</u> the labels (A, B, C or D) of the orbitals that are filled with electrons in butadiene.

8. According to model 3, <u>determine</u> the values of the  $\pi$  wavefunctions  $\psi_n$  for occupied levels at positions 0, L/4 and L/2, for n=1 and n=2, as a function of L.

 $\psi_1(0) =$ 

 $\psi_1\left(\frac{L}{4}\right) =$ 

 $\psi_1\left(\frac{L}{2}\right) =$ 

 $\psi_2(0) =$ 

 $\psi_2\left(\frac{L}{4}\right) =$ 

 $\psi_2\left(\frac{L}{2}\right) =$ 

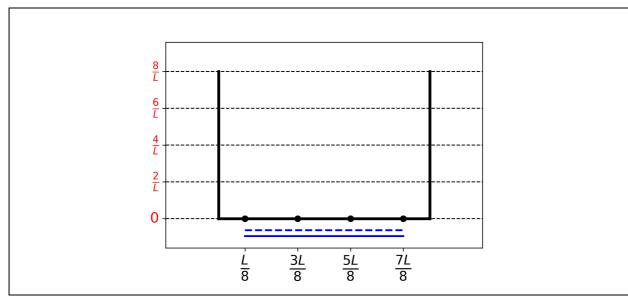

9. According to model 3, <u>determine</u> the values of the  $\pi$  electron density at positions 0, L/4 and L/2.

$$\rho(0) =$$

$$\rho\left(\frac{L}{4}\right) =$$

$$\rho\left(\frac{L}{2}\right) =$$

10. **Draw** the  $\pi$  electron density between 0 and L.

- 11. <u>Rank</u> the following CC bond lengths (B1, B2, ..., B5) from shortest to longest, using the symbols = or < .
  - B1: C1C2 in the butadiene molecule
  - B2: C2C3 in the butadiene molecule
  - B3: C3C4 in the butadiene molecule
  - B4: CC in the ethane molecule
  - B5: CC in the ethene molecule

# Problem T2: Hydrogen production by water-splitting

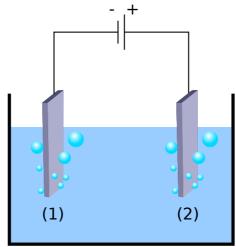

#### Data:

Compound	$H_2(g)$	H <sub>2</sub> O(1)	H <sub>2</sub> O(g)	O <sub>2</sub> (g)
$\Delta_{\rm f} H^{\circ} ({\rm kJ~mol}^{-1})$	0	-285.8	-241.8	0
$S_{\mathrm{m}}^{\circ} (\mathrm{J} \; \mathrm{mol}^{-1}  \mathrm{K}^{-1})$	130.6	69.9	188.7	205.2

Molecular hydrogen (H<sub>2</sub>) can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1.	write the balanced equation of the liquid water splitting reaction using a stoichiometric coefficient of 1 for water.
2.	Using only the thermodynamic data provided above, <u>justify numerically</u> whether this reaction is thermodynamically favorable at 298 K.
Ca	lculations:
Re	eaction thermodynamically favorable?
	□ Yes □ No

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected to a power supply (Fig. 1). Gas bubbles are formed at both electrodes.

*Fig. 1 – Water-splitting electrochemical cell.* 

3. Write the balanced net electrochemical half reactions occurring at each electrode.

On electrode (1):		
On electrode (2):		

4. Using only the thermodynamic data provided above (or question 2), **calculate** (to three decimal places)  $\Delta E_{\text{th}}$  necessary for the process. **Check** the appropriate box for the correct condition such that the reaction will be thermodynamically favorable at 298 K when all reactants and products are in their standard states.

Calculation:							
	$\Delta E_{\text{th}} =V$ (give the result with 3 decimal places)						
$\Box  \Delta E_{\text{applied}} = \Delta E_{\text{th}}$							
$\Box$ $\Delta E_{\text{applied}} > \Delta E_{\text{th}}$							
$\square$ $\Delta E_{\text{applied}} < \Delta E_{\text{th}}$							
If you could not calculate $\Delta E_{th}$ , the value 1.200 V can be used in the rest of the problem.							

Experimentally, a higher voltage is needed to split water. For a given Pt cathode, the minimum voltage necessary to observe water splitting,  $\Delta E_{\min}$ , depends on the nature of the anode as displayed in the table below:

Anode	$\Delta E_{\min}$ (V)
$IrO_x$	1.6
$NiO_x$	1.7
$CoO_x$	1.7
$Fe_2O_3$	1.9

The difference between  $\Delta E_{\min}$  and  $\Delta E_{th}$  is the "loss" in the device.

5. <u>Give</u> the expression of the device power efficiency  $\eta_{elec}$  (fraction of the power used for water splitting) as a function of  $\Delta E_{th}$  and  $\Delta E_{min}$ . Assuming an identical current value *I*, <u>calculate</u> the water electrolysis power efficiency when a Pt cathode and a Fe<sub>2</sub>O<sub>3</sub> anode are used. <u>Select</u> the most efficient anode from the table above.

 $\eta_{
m elec} =$ 

Power efficiency when a Pt and a Fe<sub>2</sub>O<sub>3</sub> electrodes are used:

 $\eta_{
m elec}$  = %

Most efficient anode:

If you could not calculate  $\eta_{elec}$ , the value  $\eta_{elec} = 75\%$  can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

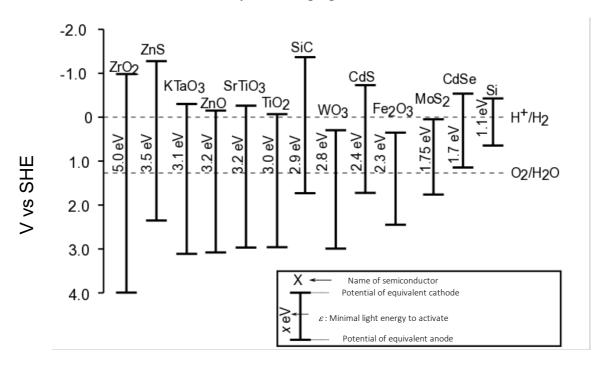

Fig. 2 – Activation conditions and equivalent electrode potentials of different semiconductors.

Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard

Hydrogen Electrode

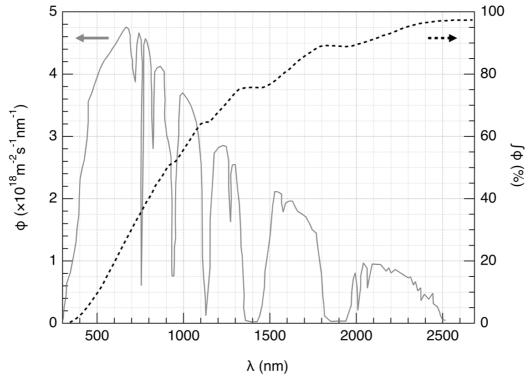

Fig. 3 – Left axis: Spectral distribution of the solar photon flux  $\phi$ . The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with smaller wavelength).

6. Estimate the fraction of semiconductors: TiO <sub>2</sub> , CdS computation.	the so, Si. Ex	olar photon flux t plicitly <u>include</u> the	hat can ac equations a	tivate the following and units used for the

#### **Problem T3: About silver chloride**

#### Data at 298 K:

 $pK_{s1}(AgCl) = 9.7; pK_{s2}(Ag_2CrO_4) = 12$ 

Formation constant of the complex  $[Ag(NH_3)_n]^+$ :  $\beta_n = 10^{7.2}$ 

Potentials against the standard hydrogen electrode:

Standard potential of  $Ag^+/Ag(s)$ :  $E^{\circ}(Ag^+/Ag(s)) = 0.80 \text{ V}$ 

Apparent potential of  $O_2(aq)/OH^-(aq)$  (in seawater):  $E'(O_2(aq)/OH^-(aq)) = 0.75 \text{ V}$ 

#### Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778–1850) deal with some properties of silver chloride.

**Quote A:** "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."

Quote B: "This salt has no taste since it is insoluble."

**Quote C:** "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."

Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."

Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."

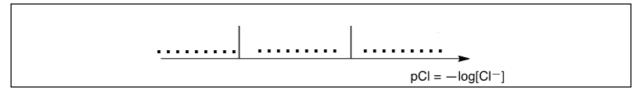

**Quote F:** "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

2. **Quote B:** Calculate the solubility s of AgCl(s) in water at 298 K in mol  $L^{-1}$ .

1. **Quote A:** Write the balanced chemical equation of AgCl(s) synthesis.

Calculation:		
	s =	$mol L^{-1}$

3. **Quote C:** In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry 1:2 is formed. On the following qualitative axis (with pCl increasing from left to right), **place** on each dotted line the dominant silver-containing species. pCl values at frontiers are not expected.

**Quote D:** When ammonia is added to silver chloride, a well-defined complex of stoichiometry n is formed.

4. Write the balanced equation corresponding to the synthesis of the complex  $[Ag(NH_3)_n]^+$  from silver chloride and <u>calculate</u> the corresponding equilibrium constant.

nom on on one and entertains and concesponding equinorium consum.
Equation:
Calculation:
K =
If you could not calculate $K$ , the following value can be used in the rest of the problem: $K = 10^{-3}$

5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears. At this moment,  $[NH_3] = 1.78 \text{ mol } L^{-1}$ . **Determine** the stoichiometry of the complex neglecting dilution effects.

Calculation:	
	n =

6.	<u>Write</u> the balanced chemical equation corresponding to <b>quote</b> E.
7.	Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions, <u>write</u> a balanced chemical equation corresponding to the formation of the solid mentioned in <b>quote F.</b> A stoichiometric coefficient of 1 will be <u>chosen for dioxygen</u> . <u>Calculate</u> its equilibrium constant <i>K</i> at 298 K.
Equ	uation:
Cal	culation:
	K =

#### Part B: The Mohr method

The Mohr method is based on the colorimetric titration of Cl<sup>-</sup> by Ag<sup>+</sup> in the presence of potassium chromate  $(2K^+, CrO_4^{2^-})$ . Three drops (~ 0.5 mL) of a  $K_2CrO_4$  solution at about  $7.76 \cdot 10^{-3}$  mol L<sup>-1</sup> are added to  $V_0 = 20.00$  mL of a sodium chloride solution of unknown concentration  $C_{\text{Cl}}$ . This solution is then titrated by silver nitrate  $(Ag^+, NO_3^-)$  at  $C_{\text{Ag}} = 0.050$  mol L<sup>-1</sup>, which immediately leads to the formation of solid **A**. A red precipitate (solid **B**) appears at  $V_{\text{Ag}} = 4.30$  mL.

8.	Write the balanced equations of the two reactions occurring during the experiment.  Calculate the corresponding equilibrium constants.
	$K^{\circ}{}_{1}=$
	$K^{\circ}{}_{2}=$
9.	<u>Identify</u> the solids.
	Solid A:
	Solid B:
10.	. <u>Calculate</u> the unknown concentration $C_{Cl}$ of chloride ions in the sodium chloride solution.
Ca	lculation:
	$C_{\rm Cl} = \mod \mathrm{L}^{-1}$
	If you could not calculate $C_{\rm Cl}$ , the value $C_{\rm Cl} = 0.010$ mol $L^{-1}$ can be used in the rest of the problem.

11. Calculate the minimal volume $V_{Ag}(min)$ for which AgCl(s) precipitates.
Calculation:
$V_{\rm Ag}(\min) = $ mL
12. <u>Calculate</u> the residual concentration [Cl <sup>-</sup> ] <sub>res</sub> of chloride ions when silver chromate begins to precipitate. <u>Justify</u> why CrO <sub>4</sub> <sup>2-</sup> is a good titration endpoint indicator by comparing the
two values.
Calculation:
$[C1^-]_{res} = mol L^{-1}$
CrO <sub>4</sub> <sup>2-</sup> is a good titration endpoint indicator because:

# Problem T4: From gunpowder to the discovery of iodine

In the 19th century, French entrepreneur B. Courtois specialized in the production of nitrate A  $(\mathbf{M}_{\mathbf{A}}(\mathbf{NO}_3)_m)$ , used for gunpowder. Initially imported from Asia, A was later produced from nitrate B (M<sub>B</sub>(NO<sub>3</sub>)<sub>n</sub>) using an exchange reaction with compound C, obtained from algae.

	2 (1/2B(1/03)h) woning wit offerming remained with compound of common near mignet
1.	<u>Determine</u> the formulas of nitrates <b>A</b> and <b>B</b> knowing that they are anhydrous salts of alkaline or alkaline-earth metal ( $M_A$ and $M_B$ ). One of the nitrates contains no more than 1 w% of non-metallic impurities while the other contains 9 $\pm$ 3 w% of impurities. The content of metals $M_A$ and $M_B$ in the samples is 38.4 w% and 22.4 w% respectively. <u>Support</u> your answer with calculations.
	$\mathbf{A}$ : and $\mathbf{B}$ :

To obtain **A**, 262.2 g of solid compound **C** were added to the solution containing 442.8 g of **B**. **B** is known to be in excess. As a result, 190.0 g of white precipitate **D** were formed and removed by filtration. The filtrate was evaporated, and solid mixture **E** was isolated and heated until the mass of the sample (containing only nitrites,  $NO_2^-$ ) was constant. The only gaseous product was dioxygen: 60.48 L at 0 °C and 1 atm (dioxygen can be considered as an ideal gas).

Ке	action between <b>B</b> and <b>C</b> :	

In 1811, when working with algae ashes, Courtois observed that copper containers wore out faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled a solution of concentrated sulfuric acid on the dry algae ashes. Violet vapors appeared instantly (1, sulfuric acid is the oxidizing agent) and iodine (I<sub>2</sub>) had just been discovered! Iodine was the cause of the copper corrosion (2). However, because of the medicinal applications of iodine, Courtois opened a new facility to produce it by reacting algae with chlorine (3). Nowadays, iodine is prepared from the following reactants: NO<sub>3</sub><sup>-</sup>, I<sup>-</sup>, H<sup>+</sup> (4) or IO<sub>3</sub><sup>-</sup>, I<sup>-</sup>, H<sup>+</sup> (5).

#### 4. Write balanced equations for reactions 1–5.

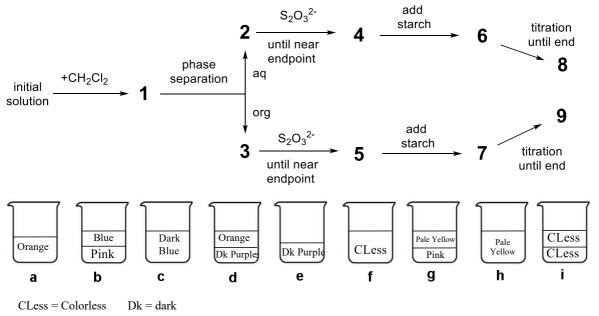

1		
2		
3		
4		
5		

The solubility of iodine is very low in water, but significantly increases when iodide ions are added. Together they form ions such as triiodide, I<sub>3</sub><sup>-</sup>:

$$I^{-}(aq) + I_{2}(aq) \rightleftharpoons I_{3}^{-}(aq)$$
 (6)

Equilibrium (6) can be studied through the extraction of  $I_2$  with dichloromethane. Indeed,  $I^-$  and  $I_3^-$  do not dissolve in organic solvents but  $I_2$  does and, when extracted, it is 15 times more concentrated in dichloromethane than in water.

To determine the solubility of  $I_2$  in dichloromethane, the following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide (0.1112 g). Then, 50.0 mL of dichloromethane were added and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated by 16.20 mL (organic phase) and by 8.00 mL (aqueous phase) with a standardized aqueous solution of sodium thiosulphate pentahydrate (14.9080 g in 1.000 L of solution) in the presence of starch. The process is schematically represented below:

# Problem T5: Azobenzene – $\beta$ -cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of energy into nanomovement for applications such as drug delivery. Numerous nanomachines use light energy to isomerize azo compounds (R–N=N–R').

1. <u>Draw</u> the stereoisomers of azobenzene ( $H_5C_6-N=N-C_6H_5$ ) and <u>draw</u> a line between the two carbon atoms in each structure that are the furthest apart. <u>Compare</u> these two distances ( $d_{\text{trans}}$  and  $d_{\text{cis}}$ ).

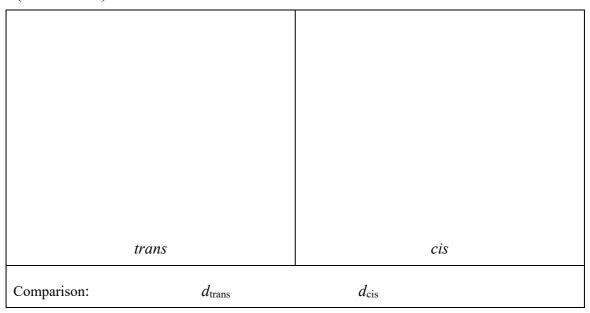

Fig. 1 – Possible reactants for the synthesis of M.

2. **M** can be synthesized in two steps from simple reactants (Fig. 1). <u>Choose</u> the reactants (N to Q) that can provide M with very high regioselectivity. Sodium nitrite (NaNO<sub>2</sub>) in cold aqueous hydrochloric acid are used as reagents for the first step of the synthesis.

Reactants: and

#### Determination of the association constant $K_t$

 $\beta$ -cyclodextrin (C, Fig. 2) is a cyclic heptamer of glucose which can form inclusion complexes with azo compounds. In tasks 3 to 6, using spectroscopy, we will determine the association constant  $K_t$ , corresponding to the formation of the inclusion complex CM<sub>trans</sub> as depicted in Fig. 2.

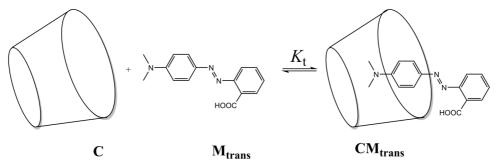

Fig. 2 – Formation of the CM<sub>trans</sub> inclusion complex.

Several solutions were prepared by mixing C and  $M_{trans}$  in different proportions to reach initial concentrations  $[C]_0$  and  $[M_{trans}]_0$ . While  $[M_{trans}]_0$  is identical for all solutions,  $[C]_0$  varies. We followed, at a fixed wavelength, the change in absorbance,  $\Delta A$ , between the absorbance of each  $CM_{trans}$  solution and the pure  $M_{trans}$  solution. The molar extinction coefficients of  $CM_{trans}$  and  $M_{trans}$ , are noted as  $\varepsilon_{CMtrans}$  and  $\varepsilon_{Mtrans}$ , respectively. L is the path length. The absorbance of C ( $\varepsilon_{C}$ ) is negligible.

3. **Prove** mathematically that  $\Delta A = \alpha \cdot [\mathbf{CM_{trans}}]$  and **express**  $\alpha$  in terms of the constant(s) provided above.

Demonstration:			
	$\alpha$ =	=	

4.	<u>Prove</u> that, when C is in large excess with respect to $M_{trans}$ (i.e. $[C]_0 >> [M_{trans}]_0$ ), the concentration of C may be considered as constant, $[C] \simeq [C]_0$ .
Pro	of:
5.	<b>Show</b> that, when C is in large excess with respect to $M_{trans}$ (i.e. $[C]_0 >> [M_{trans}]_0$ ),
	$\Delta A = \alpha \cdot \frac{\beta \cdot [\mathbf{C}]_0}{1 + K_t \cdot [\mathbf{C}]_0}$ and $\underline{\mathbf{express}} \beta$ in terms of constant(s) and initial concentration(s).
De	monstration:
	eta =

6. **Determine**  $K_t$  using the following experimental curve (Fig. 3).

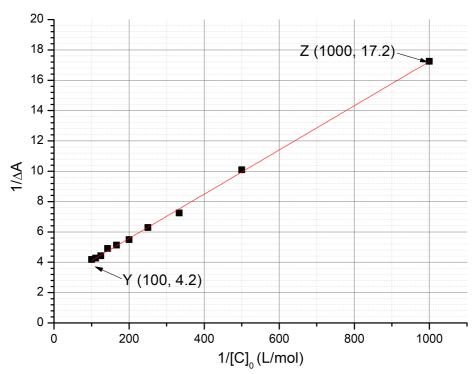

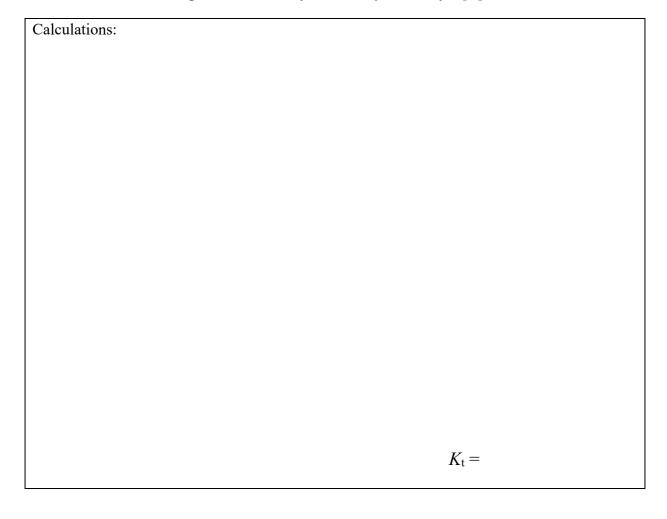

Fig. 3 – Evolution of  $1/\Delta A$  as a function of  $1/[C]_0$ .

#### Determination of the association constant $K_c$

In tasks 7 to 9, using kinetic studies, we will determine the association constant,  $K_c$ , corresponding to the formation of the inclusion complex with  $\mathbf{M_{cis}}$ ,  $\mathbf{CM_{cis}}$ . A sample containing only  $\mathbf{M_{trans}}$  is irradiated and produces a known amount of  $\mathbf{M_{cis}}$ ,  $[\mathbf{M_{cis}}]_0$ .  $\mathbf{M_{cis}}$  (free or within the inclusion complex) then thermally isomerizes into  $\mathbf{M_{trans}}$ . In the absence of  $\mathbf{C}$ , the isomerization follows first-order kinetics with a rate constant  $k_1$ . All complexation equilibria are faster than the isomerization process. The kinetic scheme corresponding to this experiment is provided in Fig. 4.

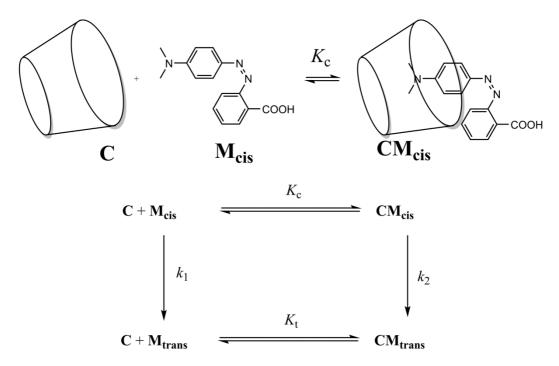

Fig. 4 – Kinetic scheme for the isomerization of  $M_{cis}$  in the presence of C.

The rate of disappearance r for the total amount of  $\mathbf{M}_{cis}$  (free and complexed) is defined as

$$r = k_1[\mathbf{M_{cis}}] + k_2[\mathbf{CM_{cis}}]$$

Experimentally, r follows an apparent first order kinetic law with an apparent rate constant  $k_{obs}$ :

$$r = k_{\text{obs}}([\mathbf{M_{cis}}] + [\mathbf{CM_{cis}}])$$

|--|

$\gamma =$ and $\delta =$

8. <u>Choose</u> the condition(s) where the half-life  $(t_{1/2})$  corresponds to  $k_{\text{obs}}$  and <u>prove</u> mathematically that  $t_{1/2}$  can be expressed as  $t_{1/2} = \frac{\ln 2}{\gamma} (1 + K_{\text{c}}[\mathbf{C}]_0)$  given that  $[\mathbf{C}]_0 >> [\mathbf{M}_{\text{cis}}]_0$ .

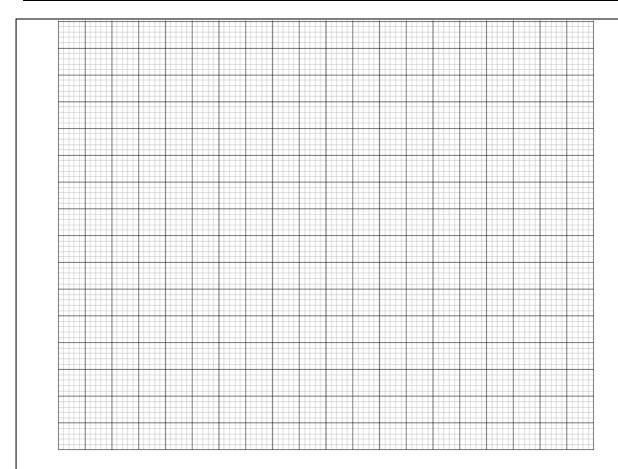

Very slow isomerization of $M_{cis}$ within cyclodextrin
Vary slavy isomorphism of free M.

- $\square$  Very slow isomerization of free  $\mathbf{M}_{cis}$
- ☐ CM<sub>cis</sub> very stable
- $\square$  CM<sub>trans</sub> very stable

Proof:

9. Assuming the condition(s) in task 8 are satisfied, <u>determine</u>  $K_c$  by a linear regression using the data below. You may use a calculator or plot a graph.

$[\mathbf{C}]_0 \text{ (mol } \mathbf{L}^{-1})$	$t_{1/2}$ (s)	$[\mathbf{C}]_0 \text{ (mol } \mathbf{L}^{-1})$	$t_{1/2}$ (s)
0	3.0	$3.0 \cdot 10^{-3}$	5.9
$1.0 \cdot 10^{-4}$	3.2	$5.0 \cdot 10^{-3}$	7.7
$5.0 \cdot 10^{-4}$	3.6	$7.5 \cdot 10^{-3}$	9.9
$1.0 \cdot 10^{-3}$	4.1	$1.0 \cdot 10^{-2}$	12.6

Equation of the linear regression:

#### Formation of nanomachines

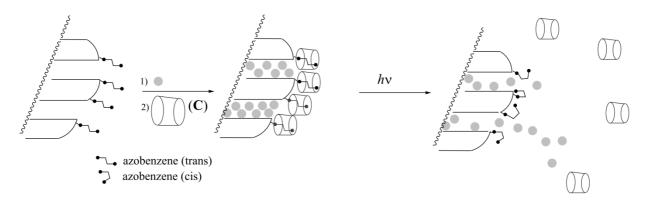

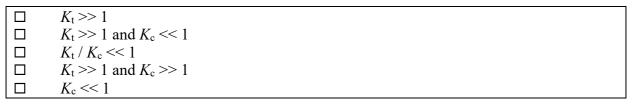

Fig. 5 – Cleavage of an azobenzene-cyclodextrin inclusion complex induced by a light-triggered isomerization, which allows delivery of a drug (grey sphere).

Another azobenzene compound (for which  $K_c \ll K_t$ ), initially in the *trans* form, is covalently grafted on silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, grey circles in Fig. 5). Upon addition of  $\mathbb{C}$ , an inclusion complex is formed, which blocks the pores and prevents the release of the dye.

10. <u>Choose</u> the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of C, and the dye can be released upon irradiation.

This azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that this azobenzene powder cannot move into solution. The powder is irradiated at a wavelength  $\lambda_1$  to trigger the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength  $\lambda_2$ .

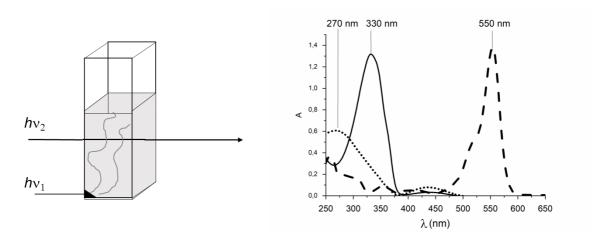

Fig. 6 – Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line) and rhodamine B (dashed line).

## 11. **Determine** $\lambda_1$ .

# Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule are studied.

#### Study of the first block

In the first part, we will study the water soluble homopolymer 1 ( $\alpha$ -methoxy- $\omega$ -aminopolyethyleneglycol).

The <sup>1</sup>H NMR spectrum of 1 (DMSO- $d_6$ , 60 °C, 500 MHz) includes the following signals:

Index	δ (ppm)	Peak Area	
a	2.7*	0.6	
b	b 3.3 0.9		
С	3.4	0.6	
d	~ 3.5	133.7	

Table 1, \*in the presence of  $D_2O$ , the signal at 2.7 ppm disappears.

1. **Match** the <sup>1</sup>H NMR signals (a, b, c, d) from Table 1 with each of the corresponding protons.

2. Express the average degree of polymerization n as a function of the area  $A_{\text{OC2H4}}$  of the NMR peak of the repeating unit and the area  $A_{\text{OCH3}}$  of the NMR peak of the methyl end group. Calculate n.

Expression: n =If you could not calculate n, the value n = 100 can be used in the rest of the problem.

### Study of a diblock-copolymer

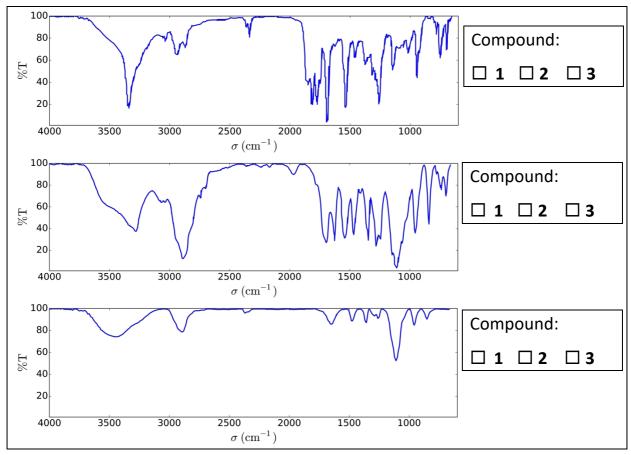

The synthesis of the second block of the copolymer is performed through the reaction of 1 with 2 ( $\varepsilon$ -(benzyloxycarbonyl)-lysine N-carboxyanhydride). This yields the block-copolymer 3.

3. <u>Draw</u> the reaction intermediate that is formed in the first step of the addition of 1 to 2. The second step of the mechanism leads to the formation of a gas molecule, G. <u>Draw</u> the structure of gas G.

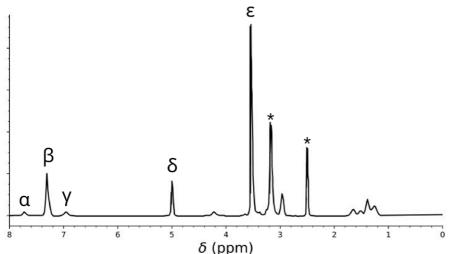

$$H_2N \longrightarrow OCH_3 + OCH_3 + OCH_3 - OCH_3$$

I	Z		
Intermediate:			
		G:	

4. Infrared (IR) measurements were performed to characterize the compounds. <u>Match</u> the three IR spectra with compounds 1, 2 and 3.

5. The <sup>1</sup>H NMR spectrum of copolymer **3** (in DMSO- $d_6$ , at 60 °C, 500 MHz) is reported in Fig. 1. Using some or all of the NMR signals, the areas of which are reported in Table 2, **calculate** its average molar mass  $M_n$ , considering n from question 2. **Draw** a circle around the group(s) of atoms you used in the calculation and **label** it with the corresponding symbol(s)  $(\alpha, \beta, ...)$ .

	The second secon		
Fig. $1$ – signals marked with	* correspond	to the solvent	and water.

В	119					
γ	23.8					
δ	47.6					
3	622					

 $M_{\rm n} = {\rm kg \ mol^{-1}}$  Provide your answer with two decimal places.

This reaction of 1 with 2 yielded the copolymers 3a (after 20 h), 3b (after 25 h), and 3c (after 30 h) at a temperature of 40 °C. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

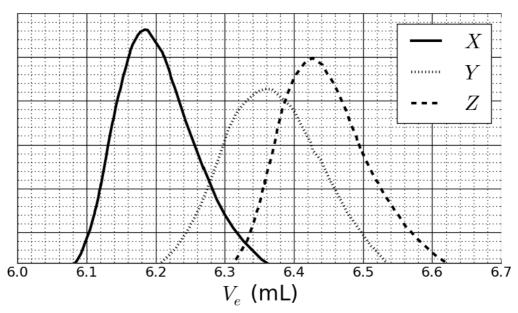

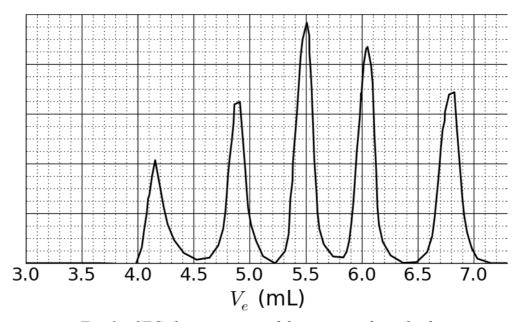

Fig. 2 – SEC chromatograms of 3a, 3b and 3c as a function of the elution volume,  $V_e$ .

6. Match the curves in Fig. 2 with the copolymers 3a, 3b and 3c.

3a:	$\square X$	$\square Y$	$\square Z$	
3b:	$\square X$	$\square Y$	$\square Z$	
3c:	$\square X$	$\square Y$	$\square Z$	

In order to calibrate the chromatogram, a mixture of standard polymers of known molar masses (3, 30, 130, 700 and 7000 kg mol<sup>-1</sup>) were studied (Fig. 3).

The log value of the molar mass is a linear function of the elution volume,  $V_{e}$ .

*Fig. 3 – SEC chromatogram of the mixture of standards.* 

7. Based on the SEC curves in Fig. 2 and 3, <u>determine</u>  $V_e$  of the polymer that corresponds to curve X and use it to <u>estimate</u> the degree of polymerization m of its second block. <u>Detail</u> your calculation; you may use a calculator or plot a graph.

$V_{\rm e} =$	mL			

### **Triblock copolymer synthesis**

For biological applications involving the formation of micelles, a triblock copolymer 9 can be synthesized through the introduction of a middle block, **B**, using monomer 5.

#### 8. **Draw** the structures of **5**, **7** and **8**.

5 (the only product obtained is 6:A-B)

7 (you do not need to show the gas that is also formed in the third reaction of this sequence)

8

9. Amphiphilic block copolymers, such as **9: A-B-C**, can be used for medical applications, because they self-assemble into micelles in water (pH = 7), which can be used as drug carriers. <u>Assign</u> each block of the copolymer to a property. <u>Draw</u> a scheme of the micelle with only 4 polymer chains.

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper (+I or +II), two configurations are possible (Fig. 1).

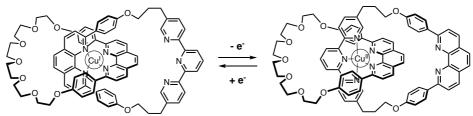

Fig. 1 - Multi-stability of a ring in a [2]catenane.

The synthesis of the macrocycle is the following:

$$\begin{array}{c} \text{Br} \\ \text{C} \\ \text{Clequiv.} \end{array}$$

# **Problem T8: Identification and synthesis of inositols**

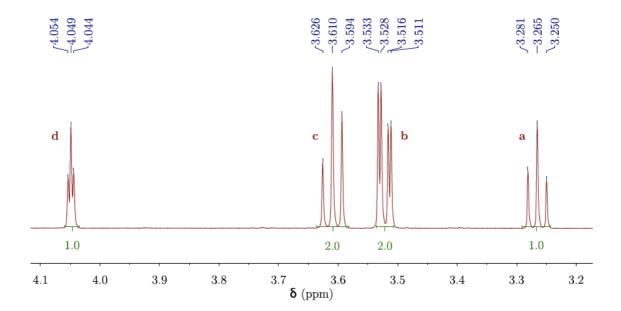

In this problem, we define "3D structure" and "perspective formula" as indicated for  $\beta$ -glucose in the following figure.

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular *myo*-inositol, are involved in a number of biological processes.

### Structure of myo-inositol

1. <u>Draw</u> the structure of an inositol without stereochemistry.
This family of molecules contains 9 different stereoisomers, including enantiomers.
2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active.

The structure of a specific inositol, called myo-inositol is studied here. Only one of its chair conformers is significant and the structure can be deduced from its  $^1H$  NMR spectrum. The spectrum below was obtained at 600 MHz in  $D_2O$ . No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. <u>Give</u> the molecular formula of the predominant compound (derived from *myo*-inositol) in this sample that is consistent with the number of protons observed in the <sup>1</sup>H NMR spectrum.

4. Based on the number and integrations of the proton signals, **give** the number of symmetry plane(s) that is(are) present in this molecule.

5. <u>Complete</u> the following perspective drawing of the most stable conformation of *myo*-inositol. Then <u>label</u> each hydrogen with the corresponding letter (a, b, c or d) according to the NMR spectrum above. Proton a must be on carbon a on the following representation. **Draw** its 3D structure.

### Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. <u>Choose</u> the correct structural relationship(s) between 2 and 3.

Inositol 2 can be obtained from compound 1 in 7 steps.

7.	<u>Draw</u> the 3D structure of 4.
4	
8.	The reaction leading to 5 occurs on the double bond with the highest electron density Consider below the structure of 1-bromo-1,3-cyclohexadiene, which is a portion of 4 <u>Circle</u> the double bond with the highest electron density. <u>Draw</u> separate structures to represent all of the electronic effects due to the bromine.
	Br
9.	<u>Draw</u> the 3D structure of the major diastereomer 5.
5	
10.	<u>Give</u> the total number of stereoisomers of 5 possibly obtained by this synthesis, starting from enantiopure compound 1.
11.	For the step $5 \rightarrow 6$ , another product with the same molecular formula, denoted $6$ ', can be produced. <u><b>Draw</b></u> the 3D structures of $6$ and $6$ '.
6	6'

12.	<u>Draw</u> the 3D structures of major diastereom	ners 8 and 9.
8		9

## **Problem T9: Synthesis of levobupivacaine**

#### Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

$$CI^ H_3\dot{N}$$
 $O^-$ 

L-Lysine hydrochloride

1. <u>Assign</u> the absolute configuration of the stereogenic center in L-lysine hydrochloride and <u>justify</u> your answer by ranking the substituents in order of their priority.

Configuration:	Priority 1 > 2 > 3 > 4:			
$\square R$	NH <sub>3</sub> <sup>+</sup> Cl	44 NH3+	1000	N H

2. The prefix L in L-lysine refers to relative configuration. **Choose** all correct statements:

- ☐ All natural L-amino acids are levorotatory.
- ☐ Natural L-amino acids can be levorotatory or dextrorotatory.
- $\square$  All natural L-amino acids are (S).
- $\square$  All natural L-amino acids are (R).

Often, we want only one of the amino groups in L-lysine to react. A  $Cu^{2+}$  salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed  $NH_2$  group is available to react.

3. If L-lysine acts as a bidentate ligand and two L-lysines coordinate to one Cu<sup>2+</sup> ion in the presence of aqueous hydroxide, **draw** the structure of the complex.

Complex

Similarly, in the synthesis of levobupivacaine shown below, only one amino group reacts without the use of a  $Cu^{2+}$  salt.

$$\begin{array}{c} \text{Cl}^{-} \\ \text{H}_{3} \\ \text{N} \\ \text{L-Lysine} \\ \text{hydrochloride} \\ \end{array} \begin{array}{c} \text{1) 1 eq. LiOH} \\ \text{2) 1 eq. PhCHO} \\ \end{array} \begin{array}{c} \text{A} \\ \end{array} \begin{array}{c} \text{1) NaOH, Cbz-Cl} \\ \text{2) diluted HCl} \\ \text{3) aqueous buffer} \\ \text{pH 6.2} \\ \end{array} \begin{array}{c} \text{R} \\ \text{C}_{14} \\ \text{H}_{20} \\ \text{N}_{2} \\ \text{O}_{4} \\ \end{array} \\ \end{array} \begin{array}{c} \text{NaNO}_{2}, \text{NaOAc} \\ \text{AcOH} \\ \text{C}_{16} \\ \text{H}_{21} \\ \text{NO}_{6} \\ \end{array} \begin{array}{c} \text{C} \\ \text{NH}_{2} \\ \text{DCC} \\ \end{array} \begin{array}{c} \text{D} \\ \text{DCC} \\ \end{array} \begin{array}{c} \text{1) NaOH, Cbz-Cl} \\ \text{2) diluted HCl} \\ \text{3) aqueous buffer} \\ \text{pH 6.2} \\ \end{array} \begin{array}{c} \text{E} \\ \text{C}_{29} \\ \text{H}_{34} \\ \text{N}_{2} \\ \text{O}_{6} \\ \end{array} \\ \begin{array}{c} \text{AcOH} \\ \text{C}_{16} \\ \text{H}_{21} \\ \text{NO}_{2} \\ \end{array} \begin{array}{c} \text{E} \\ \text{C}_{29} \\ \text{H}_{34} \\ \text{N}_{2} \\ \text{O}_{6} \\ \end{array} \\ \begin{array}{c} \text{AcO} \\ \text{C}_{18} \\ \text{H}_{22} \\ \text{N}_{2} \\ \end{array} \begin{array}{c} \text{C}_{18} \\ \text{H}_{28} \\ \text{N}_{2} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{O}_{21} \\ \text{Cl} \\ \text{Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{C$$

From this point on, you can use the abbreviations proposed in the scheme above.

4. **<u>Draw</u>** the structure of compound **A**, including the appropriate stereochemistry.

A			

5. The transformation of L-lysine into **A** is (**choose** proper answer(s)):

☐ an enantioselective reaction.	
an enantiospecific reaction.	
☐ a regioselective reaction.	

6.	<b>Draw</b> the structures of	compounds B-	-F, including	the appropriate	stereochemistry.
----	-------------------------------	--------------	---------------	-----------------	------------------
