THEORETICAL EXAM

Making science together!

2019-07-26

MINISTÈRE DE L'ÉDUCATION NATIONALE ET DE LA JEUNESSE

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR, DE LA RECHERCHE ET DE L'INNOVATION

General instructions

- This theoretical exam booklet contains 62 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective designed areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designed areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30-minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by ½ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

GOOD LUCK!

בהצלחה!

Table of Contents

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

Problem T1: Infinite box (חלקיק בתיבה) and butadiene	(6%)	p. 8
Problem T2: Hydrogen production by water-splitting	(7%)	p. 13
Problem T3: About silver chloride	(5%)	p. 19
Problem T4: From black powder to the discovery of iodine	(7%)	p. 24
Problem T5: Complexes for the formation of nanomachines	(8%)	p. 31
Problem T6: Characterization of a block-copolymer	(8%)	p. 40
Problem T7: Ring motion in a [2]catenane	(6%)	p. 49
Problem T8: Identification and synthesis of inositols	(6%)	p. 53
Problem T9: Synthesis of levobupivacaine	(7%)	p. 59

Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in mol L⁻¹. To further simplify formulas and expressions, the standard concentration $c^{\circ} = 1 \text{ mol } L^{-1}$ is omitted.

Problem T1: Infinite box (חלקיק בתיבה) and butadiene

The buta-1,3-diene molecule is often written CH_2 =CH-CH= CH_2 , with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the π electrons are better described as a distribution along the three bonds:

This system can be modeled as a 1D box where the electrons are free. The energy of an electron in a box of length L is: $E_n = \frac{n^2 h^2}{8m_e L^2}$, where n is a **non-zero** positive integer (מספר שונה מאפס).

1. Two different models are studied. <u>Sketch</u> at least the three lowest-energy levels E_n <u>for each</u> <u>model</u> in the respective diagrams, showing how the relative energy levels differ within and between models.

ציירו לפחות 3 מרמות האנרגיה הנמוכות ביותר של כל אחד מהמודלים בדיאגרמות. הקפידו על היחס בין רמות האנרגיה בתוך כל מודל, וגם ליחס בין רמות האנרגיה בין המודלים השונים

Model 1 (« **localized** »): The π electrons are localized on bonds 1-2 and 3-4 and are represented by two separate infinite potential boxes of length d.

Model 2 (« **delocalized** »): The π electrons are delocalized on the whole molecule and are represented by a single infinite potential box of length 3d.

2.	Place the π electrons for Model 1 in the previous diagrams and express (כתבו ביטוי) the total energy of the π system in Model 1, as a function of h , $m_{\rm e}$ and d .								
E(E(1) =								
3.	3. Place the π electrons for Model 2 in the previous diagrams and express the total energy of the π system in Model 2, as a function of h , m_e and d .								
E((2) =								
eth	e conjugation energy is the total energy of the actual π system, minus the sum of the energies of ylene molecules involving the same number of electrons. אנרגיית הצימוד היא סך האנרגיה של מערכת ה- π פחות סכום האנרגיות של מולקולות אתילן עבור אותו מספר אלקטרונים כולל								
4.	Express the conjugation energy ΔE_c of butadiene, as a function of h , m_e and d .								
ΔE	$E_{\rm c} =$								
Models 1 and 2 are too simplistic. A new model will be detailed in the following.									
5. <u>Draw</u> three other resonance structures of butadiene using Lewis notation.									
	H ₂ C CH ₂								
	· · · · · · · · · · · · · · · · · · ·								

To take into account the size of carbon atoms, Model 2 is now modified into Model 3, as follows:

- the new length of the box is L and the box is located between the x coordinates 0 and L
- the carbon atoms are located in the x coordinates $\frac{L}{8}$, $\frac{3L}{8}$, $\frac{5L}{8}$ and $\frac{7L}{8}$.

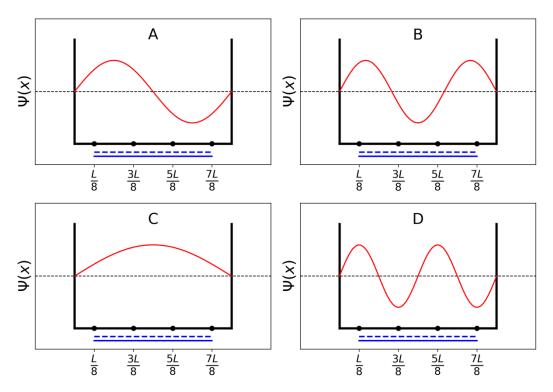

For each level n, the π wavefunction is:

$$\psi_{\rm n}(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$$

and the π electron density for a system with $N \pi$ electrons is:

$$\rho(x) = 2 \sum_{i=1}^{N/2} |\psi_i(x)|^2$$

The four π wavefunctions, which correspond to the molecular orbitals of the π system, are shown below (**arbitrary order**).

6. Sort (סדרו לפי גודל) the energies of the four π wavefunctions (E_A , E_B , E_C and E_D).

< < <

7. **Give** the labels (A, B, C or D) of the orbitals that are filled with electrons in butadiene.

8. In **Model 3**, <u>give</u> the values of the π wavefunctions ψ_n for occupied levels at positions 0, L/4 and L/2, for n=1 and n=2, as a function of L.

 $\psi_1(0) =$

 $\psi_1\left(\frac{L}{4}\right) =$

 $\psi_1\left(\frac{L}{2}\right) =$

 $\psi_{2}(0) =$

 $\psi_2\left(\frac{L}{4}\right) =$

 $\psi_2\left(\frac{L}{2}\right) =$

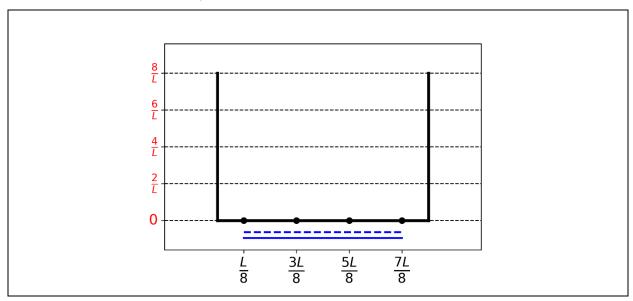

9. In **Model 3**, give the value of the π electron density at positions 0, L/4 and L/2.

$$\rho(0) =$$

$$\rho\left(\frac{L}{4}\right) =$$

$$\rho\left(\frac{L}{2}\right) =$$

10. **Draw** the π electron density between 0 and L.

- 11. <u>Sort (סדרו לפי אורכי קשרים)</u> the following CC bonds (B1, B2, ..., B5) by increasing length, using the symbols = or <:
 - B1: C1C2 in the butadiene molecule B2: C2C3 in the butadiene molecule B3: C3C4 in the butadiene molecule

B4: CC in the ethane molecule B5: CC in the ethene molecule

Problem T2: Hydrogen production by water-splitting

Data:

Compound	$H_2(g)$	H ₂ O(1)	H ₂ O(g)	O ₂ (g)
$\Delta_{\rm f} H^{\circ} ({ m kJ~mol^{-1}})$	0	-285.8	-241.8	0
$S_{\mathrm{m}}^{\circ} (\mathrm{J} \; \mathrm{mol}^{-1} \mathrm{K}^{-1})$	130.6	69.9	188.7	205.2

Molecular hydrogen (H_2) can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1.	. Write down the balanced equation of liquid water splitting reaction using a stoichiometric coefficient (מקדם סטוכיומטרי) of 1 for water.
2.	. Using only the provided thermodynamic data, justify numerically whether this reaction is thermodynamically favorable, at 298 K.
С	Calculations:
R	Reaction thermodynamically favorable?
	□ Yes □ No

Water splitting can be performed electrochemically using two electrodes in an *acidic* water bath, connected by a generator (**Fig. 1**). Gas bubbles are formed on both electrodes.

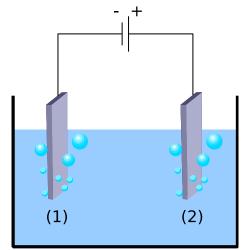

Fig. 1 – Water-splitting electrochemical cell.

3. Write down the balanced electrochemical half reactions occurring at each electrode.

On electrode (1):	
On electrode (2):	

4. Using only the provided thermodynamic data (or question T2.2):

<u>Derive</u> the condition on the applied <u>voltage</u> $\Delta E_{\text{applied}}$ between electrodes for the process to be thermodynamically favorable at 298 K, when all reactants and products are in their standard state.

- Express this condition in comparison to a numerical voltage value ΔE_{th} that you need to calculate with 3 decimal places (ספרות אחרי הנקודה העשרונית 3).
- **Tick** the right condition.

מצאו המים יהיה מועדף פיצוח כדי שתהליך כדי האלקטרודות בין האלקטרודף המופעל בין המתח בין את התנאי על המתח בין האלקטרודות בין המופעל בין המוצרים המצבים המטנדרטי. ב-298 K, כאשר כל המגיבים והתוצרים הם במצבם הסטנדרטי.

Calculation:										
\Box $\Delta E_{\text{applied}} = \Delta E_{\text{th}}$										
\square $\Delta E_{\text{applied}} > \Delta E_{\text{th}}$	where $\Delta E_{\rm th} =$	V (give the result with 3 decimal places)								
\Box $\Delta E_{\text{applied}} < \Delta E_{\text{th}}$:שרונית	תנו תשובה בדיוק של 3 ספרות אחרי הנקודה הע								
	If you could not calculate $\Delta E_{ ext{th}}$, the value 1.200 V									
	can he used in the rest of the problem									

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting, ΔE_{\min} , depends on the nature of the anode, as displayed in the table below:

Anode	$\Delta E_{\min}(V)$
IrO_x	1.6
NiO_x	1.7
CoO_x	1.7
Fe_2O_3	1.9

The difference between ΔE_{min} and ΔE_{th} is responsible for losses in the device.

5.

- <u>Give</u> the expression of the device power efficiency η_{elec} (percentage of the power used for water splitting) as a function of ΔE_{th} and ΔE_{min} .
- Assuming an identical current value I, <u>calculate</u> the water electrolysis power efficiency when a Pt cathode and a Fe₂O₃ anode are used.
- **Give** the most efficient anode.

$\eta_{ m elec}$	=
	_

Power efficiency when a Pt and a Fe₂O₃ electrodes are used:

$$\eta_{
m elec}$$
 = %

Most efficient anode:

If you could not calculate η_{elec} , the value $\eta_{elec} = 75\%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

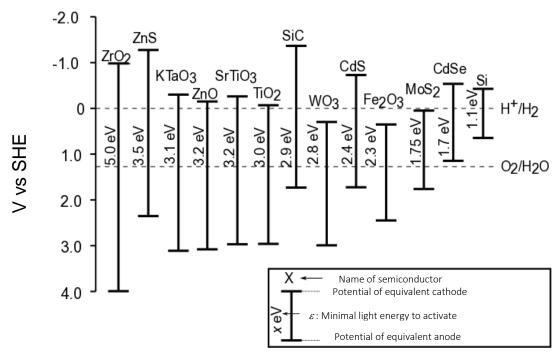

Fig. 2 – Activation condition and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard Hydrogen Electrode

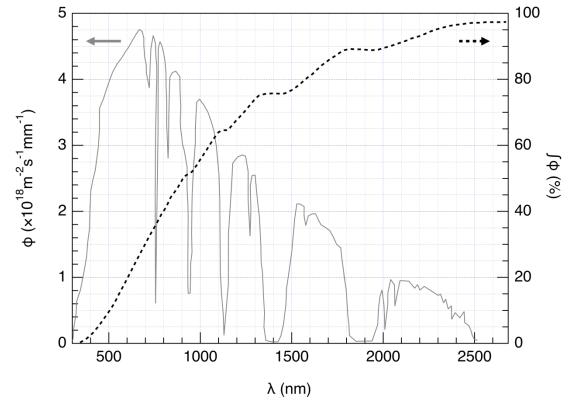

Fig.~3-Left~axis: Spectral distribution of the solar photon flux ϕ (שטף הפוטונים מהשמש לפי אורכי גל). The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line (קו מקווקו): cumulative photon flux $\int \phi$ (percentage of the photon flux with smaller wavelength) (האחוז משטף הפוטונים שעבורם אורך הגל קטן יותר).

8. <u>Give</u> the semiconductor that, u for water splitting upon a given			is expected to be the most efficient

The evolution of H_2 and O_2 (היצירה של מימן המצון) when a semiconductor is irradiated by simulated solar light at T=25 °C at $p_{\rm atm}$ was recently studied.

Using an incident power light of $P = 1.0 \text{ kW m}^{-2}$ and a photoelectrode with a $S = 16 \text{ mm}^2$ surface, the production of $V = 0.37 \text{ cm}^3$ of $H_2(g)$ was measured after $\Delta t = 1$ hour of reaction.

9.	Calculate the	power efficiency	$\eta_{\rm direct}$ of the	conversion.
----	---------------	------------------	----------------------------	-------------

y. <u>eureurate</u> me	power emercine y maneet of the conversion.	
Calculation:		
n –	%	
$\eta_{ m direct}$ =	/0	
	If you could not calculate η_{direct} , the value $\eta_{\text{direct}} = 10\%$	
	can be used in the rest of the problem.	
TD 1 C		. 1 . 1

Two modes of converting solar energy to hydrogen can thus be compared: direct photocatalysis, and indirect photo-electrolysis combining a photovoltaic panel with an electrolyzer (פוטו-אלקטרוליזה עקיפה, שמרות שילוב של תא סולרי עם מערכת לאלקטרוליזה).

The efficiency of photovoltaic panels on the market is around $\eta_{\text{panels}} = 20\%$.

10. <u>Compare</u> the power efficiencies of the two modes, η_{direct} and η_{indirect} , using Fe₂O₃ and Pt electrodes for the electrolysis.

Calculation:		
$\bigcap n_{i} \sim n_{i}$	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \eta_{ m direct}pproxpprox\eta_{ m indirect}$	\square n_{i} $< n_{i}$

Problem T3: About silver chloride

Data at 298 K:

 $pK_{sp}(AgCl) = 9.7$ $pK_{sp}(Ag_2CrO_4) = 12$

Formation constant of the complex $[Ag(NH_3)_n]^+$: $\beta_n = 10^{7.2}$

Potentials against the standard hydrogen electrode:

Standard potential of $Ag^+/Ag(s)$: $E^{\circ}(Ag^+/Ag(s)) = 0.80 \text{ V}$ Apparent potential of $O_2(aq)/HO^-(aq)$ (in seawater): $E'(O_2(aq)/HO^-(aq)) = 0.75 \text{ V}$

Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778–1850) deal with some properties of silver chloride.

Quote A: "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."

Quote B: "This salt has no taste since it is insoluble."

Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."

Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."

Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."

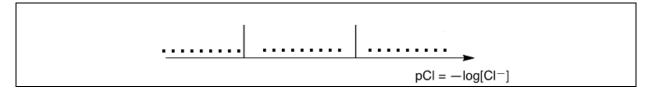

Quote F: "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

2. **Quote B:** Calculate the solubility s of AgCl(s) in water at 298 K in mol L⁻¹.

1. **Quote A:** Write the balanced chemical equation of AgCl(s) synthesis.

2. Quote D. <u>careatate</u> the solution y s of riger	s) in water at 250 K in more	
Calculation:		
	c —	$mol L^{-1}$
	s =	IIIOI L

3. **Quote C:** In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry 1:2 is formed. On the following qualitative axis (with pCl increasing from left to right), **place** in each domain (רשום בכל תהום בכל תהום species that is predominant (עיקרי) (or exists, for solids). pCl values at frontiers are not expected (בגבולות בין התחומים).

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry n is formed.

4. <u>Write</u> the balanced equation corresponding to the synthesis of the complex $[Ag(NH_3)_n]^+$ from silver chloride and <u>calculate</u> the corresponding equilibrium constant.

Equation:	
Calculation:	
Calculation.	
	K =
	If you could not calculate K , the following value can be used in the rest of the problem: $K = 10^{-3}$
	can be used in the rest of the problem: $K = 10^{-3}$

5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears (עד שכל המוצק נעלם). At this moment, $[NH_3] = 1.78 \text{ mol } L^{-1}$. **Determine** the stoichiometry of the complex neglecting dilution effects (הזניהו אפקט מיהול).

6.	<u>Write</u> the balanced chemical equation corresponding to quote E.
7.	Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions: • Write a balanced chemical equation corresponding to the formation of the solid mentioned in quote F. A stoichiometric coefficient (מקדם סטויכיומטרי) of 1 will be chosen for dioxygen. • Calculate its equilibrium constant at 298 K.

Cal	culation:
	K =

Part B: The Mohr method

The Mohr method is based on the colorimetric titration of Cl^- by Ag^+ in the presence of potassium chromate $(2K^+, CrO_4{}^{2^-})$.

Three drops (~ 0.5 mL) of a K₂CrO₄ solution at about 7.76·10⁻³ mol L⁻¹ are added to V₀ = 20.00 mL of a sodium chloride solution of unknown concentration C_{Cl} . This solution is then titrated with silver nitrate (Ag⁺, NO₃⁻) at $C_{Ag} = 0.050$ mol L⁻¹, which immediately leads to the formation of solid **A**. A red precipitate (solid **B**) appears at $V_{Ag} = 4.30$ mL.

ed precipitate (solid B) appears at $V_{Ag} = 4.30$ mL.							
8. <u>Write</u> the balanced equations of the two reactions occurring during the experiment. <u>Calculate</u> the corresponding equilibrium constants.							
$K_1 =$

Problem T4: From gunpowder to the discovery of iodine

In the 19th century, the French entrepreneur (מים) B. Courtois specialized in the production of nitrate A ($M_A(NO_3)_m$), used for gunpowder. Initially imported from Asia, A was later produced from nitrate B ($M_B(NO_3)_n$) using exchange reaction with compound C, obtained from algae ashes (אפר של אצות).

1. <u>Find</u> the formulas of nitrates A and B knowing that they are anhydrous salts of alkaline or alkaline-earth metal (M_A and M_B).

One of the nitrates contains no more than 1 w% of non-metallic impurities while the other contains 9 ± 3 w% of impurities.

The content of metals M_A and M_B in the samples is 38.4 w% and 22.4 w%, respectively.

Support your answer with calculations.

		A :	and B :				
stoi filti The san	262.2 g of solid compound $\bf C$ were added to the solution containing 442.8 g of $\bf B$. $\bf B$ is known to be in stoichiometric excess. As a result, 190.0 g of white precipitate $\bf D$ were formed and removed by filtration. The filtrate was evaporated, and the obtained solid mixture $\bf E$ was heated until the mass of the final sample (containing only nitrites, NO_2^-) was constant. The only gaseous product was dioxygen: 60.48 L at 0 °C at 1 atm (dioxygen can be considered as an ideal gas).						
2.	<u>Calculate</u> the composition (in w%) of only compounds A and B and no other in		_	_

In 1811, when working with algae ashes, Courtois observed that copper vessels were worn out faster than usual (כלי נחושת התבלו/נהרסו מהר מהרגיל).

- While he was studying this phenomenon, his cat entered the laboratory and spilled a solution of concentrated sulfuric acid on the dry algae ashes: violet vapors instantly came out of the vessel (1, sulfuric acid is the oxidizing agent): iodine (I₂) had just been discovered!
- Iodine was the cause of the copper corrosion (2).
- However, because of the medicinal applications of iodine, Courtois opened a new manufacture to produce it by reaction of algae with chlorine (3).
- Nowadays, iodine is prepared from the following combinations of reactants:
 - \circ (NO₃⁻, I⁻, H⁺) (4)

or

 \circ $(IO_3^-, I^-, H^+) (5)$

4. Write balanced equations for reactions 1–5.

1			
2			
3			
4			
5			

The solubility of iodine is very low in water, but it significantly increases when iodide ions are added. Together they form ions such as triiodide, I_3^- :

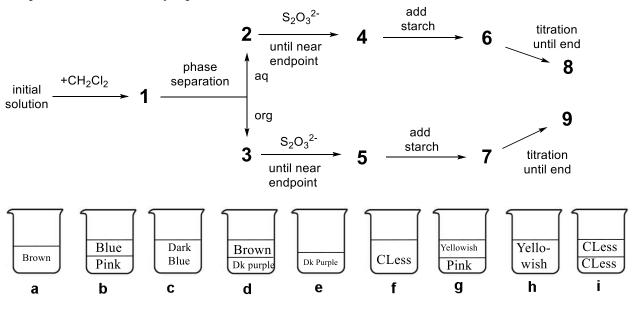

$$I^{-}(aq) + I_{2}(aq) = I_{3}^{-}(aq)$$
 (6)

Equilibrium (6) can be studied through the extraction of I_2 with dichloromethane. The anions I^- and I_3^- do not dissolve in organic solvents but I_2 does, and when extracted, it is **15 times** more concentrated in dichloromethane than in water.

The following experiment was performed:

- To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide (0.1112 g).
- Then, 50.0 mL of dichloromethane were added, and the mixture was vigorously shaken until equilibration.
- After phase separation, each phase was titrated by 16.20 mL (organic phase) and by 8.00 mL (aqueous phase) of a standard aqueous solution of sodium thiosulphate pentahydrate (14.9080 g in 1.000 L of solution) in the presence of starch.

The process is schematically represented below:

Problem T5: Azobenzene – β-cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of an energy source into a nano-movement for applications such as drug delivery. Numerous nanomachines make use of the isomerization of azo compounds (R-N=N-R) upon irradiation (הקרנה).

1. **<u>Draw</u>** the stereoisomers of azobenzene $(H_5C_6-N=N-C_6H_5)$

Draw a line between the two carbon atoms that are the furthest apart (מתחו קו בין 2 אטומי הפחמן המרוחקים ביותר (

Compare these two distances (d_{trans} and d_{cis}).

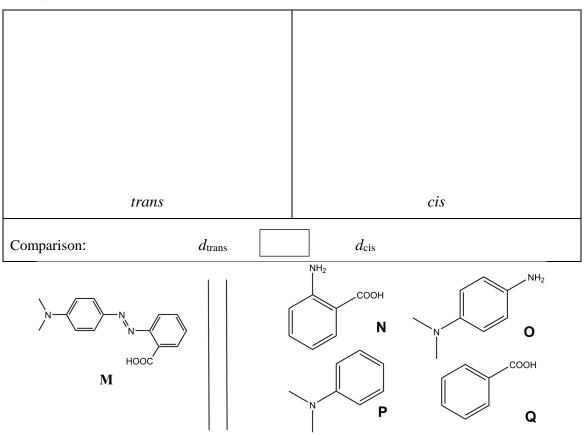

Fig. 1 – *Possible reactants for the synthesis of* M.

M can be synthesized in two steps from simple reactants (Fig. 1). Choose among the suggested reactants (N to Q) the ones that can provide M with very high regioselectivity.
 Sodium nitrite (NaNO₂) in cold aqueous hydrochloric acid is used as reagent for the first step of the synthesis.

Reactants:	and		
------------	-----	--	--

Determination of the association constant K_t

β-cyclodextrin (**C**, **Fig. 2**) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In tasks 3 to 6, we will determine with spectroscopy the association constant K_t , corresponding to the formation of the inclusion complex CM_{trans} as shown in **Fig. 2**.

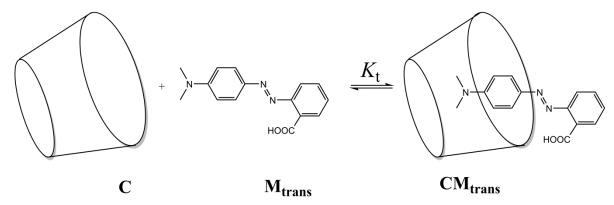

Fig. 2 – Formation of the CM_{trans} inclusion complex.

- Several solutions are prepared by mixing C and M_{trans} in different proportions to reach initial concentrations $[C]_0$ and $[M_{trans}]_0$.
- While $[\mathbf{M}_{trans}]_0$ is identical for all solutions, $[\mathbf{C}]_0$ varies.
- We follow, at a specific wavelength, the difference between the absorbance of each mixed solution and the absorbance of the pure $\mathbf{M}_{\text{trans}}$ solution (ΔA).
- We mark the molar absorption coefficients of CM_{trans} and M_{trans} as $\varepsilon_{CMtrans}$ and ε_{Mtrans} , respectively. L is the path length of the beam through the sample (ממרחק שעוברת הקרן בדוגמה).
- The absorbance of \mathbf{C} ($\varepsilon_{\mathbf{C}}$) is negligible (זניחה).
- 3. **Demonstrate** that $\Delta A = \alpha \cdot [\mathbf{CM_{trans}}]$ and **express** α in terms of known constant(s).

Demonstration:	
	$\alpha =$

	Demonstrate that, when C is in large excess with respect to concentration of C may be considered as constant, $[C] \simeq [C]_0$.	\mathbf{M}_{trans} ([C] $_0 >> [\mathbf{M}_{trans}]_0$), the			
Demonstration:					
	<u>Demonstrate</u> that $\Delta A = \alpha \cdot \frac{\beta \cdot [C]_0}{1 + K_t \cdot [C]_0}$ when C is in large				
$([\mathbf{C}]_0 >> [\mathbf{M}_{trans}]_0)$, and $\underline{\mathbf{express}} \beta$ in terms of constant(s) and initial concentration(s).					
Demo	onstration:				
		0			
		$\beta =$			

6. **Determine** K_t using the following experimental curve (**Fig. 3**).

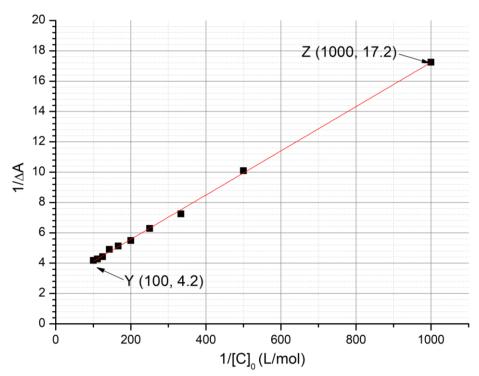

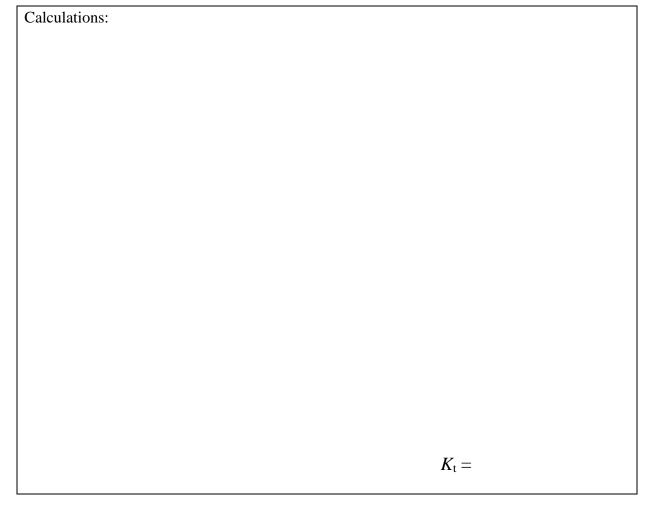

Fig. 3 – Evolution of $1/\Delta A$ as a function of $1/[C]_0$.

Determination of the association constant K_c

In tasks 7 to 9, we will determine (using kinetic studies) the association constant K_c , corresponding to the formation of the inclusion complex with \mathbf{M}_{cis} , \mathbf{CM}_{cis} .

- A sample containing only M_{trans} is irradiated, thus producing a known amount of M_{cis} , noted as $[M_{cis}]_0$.
- M_{cis} (free or within the inclusion complex) then thermally isomerizes into M_{trans} .
- In the absence of \mathbb{C} , the isomerization follows a first order kinetics with a rate constant k_1 .
- All complexation equilibria are faster than the isomerization processes.

The kinetic scheme corresponding to this experiment is provided in **Fig. 4**.

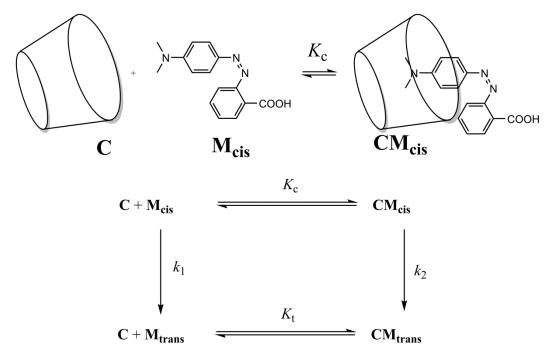

Fig. 4 – Kinetic scheme for the isomerization of M_{cis} in the presence of C.

The rate of disappearance r for the total amount of \mathbf{M}_{cis} (free and complexed) is defined as $r = k_1[\mathbf{M}_{cis}] + k_2[\mathbf{C}\mathbf{M}_{cis}]$

Experimentally, r follows an apparent first order kinetic law with an apparent rate constant k_{obs} (קבוע קצב ניסיוני):

$$r = k_{\text{obs}}([\mathbf{M_{cis}}] + [\mathbf{CM_{cis}}])$$

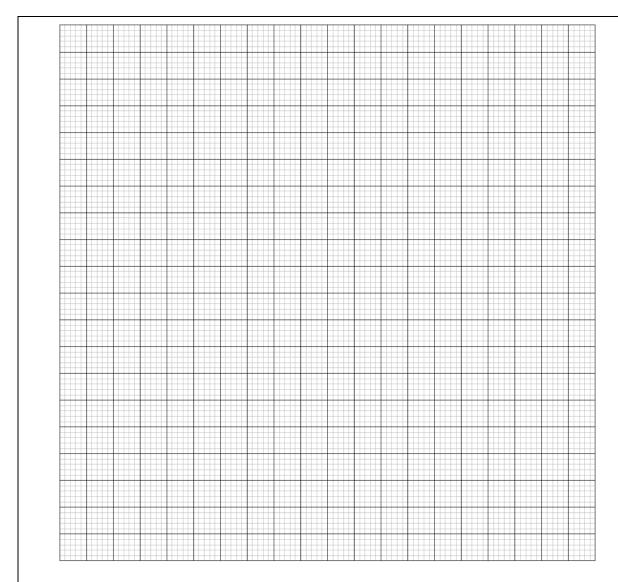

7. **<u>Demonstrate</u>** that $k_{\text{obs}} = \frac{\gamma + \delta \cdot k_2[C]}{1 + K_C[C]}$ and $\frac{\text{express}}{1 + K_C[C]} \gamma$ and δ in terms of known constant(s).

Demonstration:

	$\gamma =$	and	δ =			
8. Given that $[C]_0 >> [M_{cis}]_0$, <u>choose</u> the condition(s) at which the half-life $t_{1/2}$ corresponding to k_{obs} can be expressed as $t_{1/2} = \frac{\ln 2}{\gamma} (1 + K_c[C]_0)$. Mathematically <u>justify</u> your answer.						
	•					
Demonstration:						

9. Assuming the condition(s) in task 8 satisfied, <u>determine</u> K_c by a linear regression (התאמה לקו ישר) using the data below. You may use a calculator or plot a graph.

$[\mathbf{C}]_0 \text{ (mol } \mathbf{L}^{-1})$	$t_{1/2}$ (s)	$[\mathbf{C}]_0 \text{ (mol } \mathbf{L}^{-1})$	$t_{1/2}$ (s)
0	3.0	$3.0 \cdot 10^{-3}$	5.9
$1.0 \cdot 10^{-4}$	3.2	$5.0 \cdot 10^{-3}$	7.7
$5.0 \cdot 10^{-4}$	3.6	$7.5 \cdot 10^{-3}$	9.9
$1.0 \cdot 10^{-3}$	4.1	$1.0 \cdot 10^{-2}$	12.6

Equation of the linear regression:

Formation of nanomachines

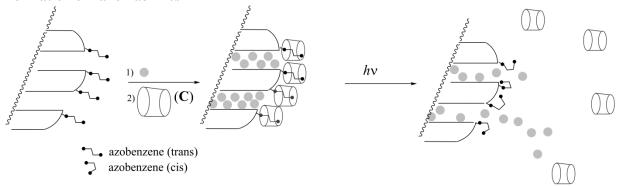

Fig. 5 – Cleavage (פֿירוק) of an azobenzene-cyclodextrin inclusion complex induced by a light-triggered isomerization, which allows delivery of a dye (grey circles).

As shown in **Fig. 5**:

- Another azobenzene compound (for which $K_c \ll K_t$), initially in the *trans* form, is covalently grafted on silica (קשור קוולנטית לסיליקה).
- The silica pores (החללים שבתוך הסיליקה) are filled with a dye (rhodamine B, grey circles in Fig.
 5).
- Upon addition of **C**, an inclusion complex is formed, which blocks the pores and prevents the release of the dye.
- 10. <u>Choose</u> the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of **C**, and the dye can be released upon irradiation.
- $\begin{array}{c|c} \square & K_t >> 1 \\ \square & K_t >> 1 \text{ and } K_c << 1 \\ \square & K_t / K_c << 1 \\ \square & K_t >> 1 \text{ and } K_c >> 1 \\ \square & K_c << 1 \end{array}$

- The azobenzene-silica powder that is loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that this powder cannot move into solution.
- The powder is irradiated at a wavelength λ_1 to trigger the release of the dye from the pores (Fig. 5).
- To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength λ_2 .

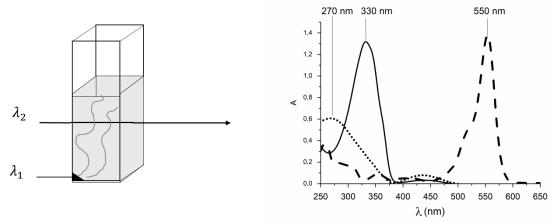

Fig.~6 – <u>Left</u>: experimental setup used to monitor the release of the dye <u>Right:</u> absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line – קו מקווקו - - - -).

11. **Determine** λ_1 .

 $\lambda_1 = nm$

12. **Determine** λ_2 .

 $\lambda_2 =$ nm

Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule is studied.

Study of the first block

$$H_2N$$
 O OCH₃

In this first part, we will study the water-soluble homopolymer 1 (α -methoxy- ω -aminopolyethyleneglycol).

The ¹H NMR spectrum of **1** (DMSO-*d*₆, 60 °C, 500 MHz) includes the following signals:

Index	δ (ppm)	Peak Area
a	2.7*	0.6
b	3.3	0.9
С	3.4	0.6
d	~ 3.5	133.7

Table 1, *in the presence of D_2O , the signal at 2.7 ppm disappears.

1. Match the ¹H NMR signals (a, b, c, d) from Table 1 with each of the corresponding protons.

2. Express the average degree of polymerization n as a function of the area $A_{OC_2H_4}$ of the NMR peak of the repeating unit and the area A_{OCH_3} of the NMR peak of the methyl end group. Calculate n.

n =

If you could not calculate n, the value n = 100 can be used in the rest of the problem.

Study of a diblock-copolymer

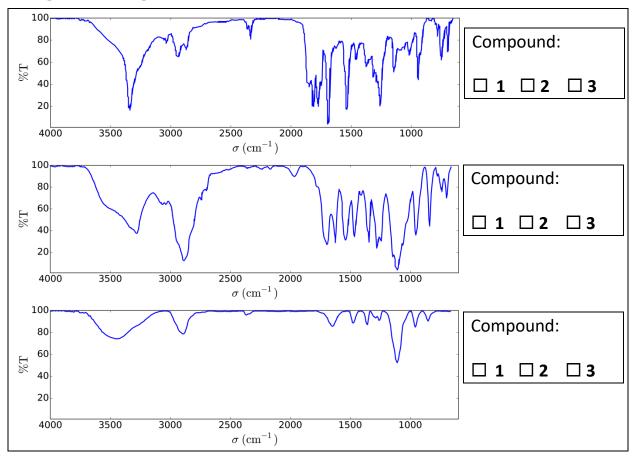

The synthesis of the second block of the copolymer is performed through the reaction of $\mathbf{1}$ with $\mathbf{2}$ (\(\xi\)enzyloxycarbonyl)-lysine N-carboxyanhydride). This yields the block-copolymer $\mathbf{3}$.

3. <u>Draw</u> the reaction intermediate that is formed in the first step of the addition of 1 to 2. The second step of the mechanism leads to the formation of a gas molecule, G. <u>Draw</u> its structure.

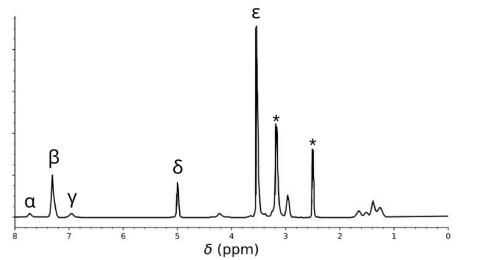

51st IChO - Theoretical Exam

G:

4. Infrared (IR) measurements are performed to characterize the compounds. <u>Match</u> the three IR spectra with compounds 1, 2 and 3.

- 5. The ¹H NMR spectrum of copolymer **3** (in DMSO- d_6 , at 60 °C, 500 MHz) is reported in **Fig. 1**.
 - Using some or all of the NMR signals, the areas of which are reported in **Table 2**, <u>calculate</u> its number average molar mass M_n , considering n from question 2.
 - For your calculations, <u>draw</u> a circle around the group(s) of atoms you used (on the molecule in the next page) and <u>give</u> their corresponding symbol(s) $(\alpha, \beta...)$.

Table 2

Fig. 1 – signals marked with * correspond to the solvent and water.

 $M_{\rm n} = {
m kg mol}^{-1}$

Provide your answer with two decimal places.

This reaction of 1 with 2 yielded copolymers: 3a after 20 h, 3b after 25 h and 3c after 30 h of reaction at 40 °C. Results of size-exclusion chromatography (SEC) experiments for each of the above are presented in Fig. 2.

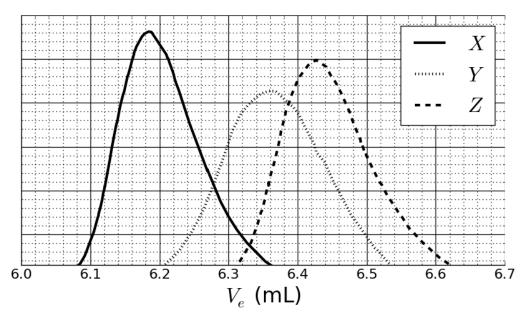

Fig. 2 – SEC chromatograms of 3a, 3b and 3c as a function of the elution volume, V_e .

6. Match the signals in Fig. 2 with the copolymers 3a, 3b and 3c.

3a:	$\square X$	$\Box Y$	$\Box Z$
3b:	$\square X$	$\square Y$	$\square Z$
3c:	$\square X$	$\square Y$	$\square Z$

To calibrate the chromatogram, a mixture of standard polymers of known masses (3, 30, 130, 700 and 7000 kg mol⁻¹) has been studied (**Fig. 3**).

The log value of the molar mass is a linear function of the elution volume, $V_{\rm e}$.

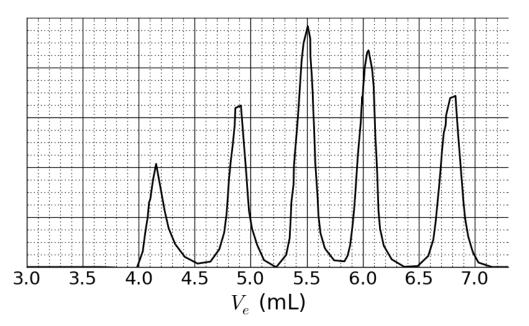

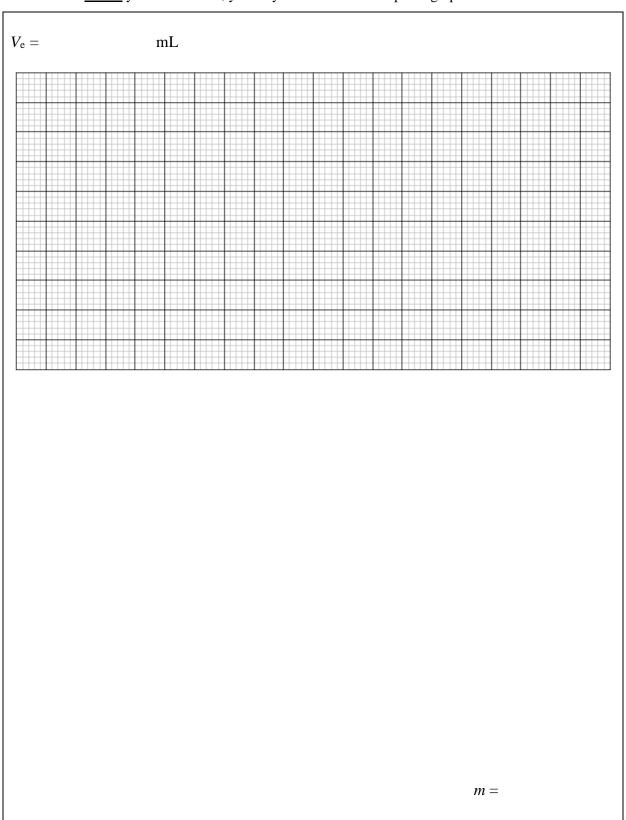

Fig. 3 – SEC chromatogram of the mixture of standards.

- 7. Based on the SEC curves in Fig. 2 and 3:
 - **Determine** V_e of the polymer that corresponds to curve X.
 - Use it to <u>estimate</u> the degree of polymerization m of its second block.
 - **Detail** your calculation; you may use a calculator or plot a graph.

Triblock copolymer synthesis

For biological applications, involving the formation of micelles (מיצלות), a triblock copolymer 9 can be synthesized through the introduction of a middle block, B, using monomer 5.

8. **Draw** the structures of **5**, **7** and **8**.

5 (no products other than 6:A-B are obtained)

7 (a gas is formed in the final step)

8

- 9. Amphiphilic block copolymers, such as 9:A-B-C, can be used for medical applications, as they self-assemble into micelles in water (pH = 7), which can be used as drug carriers.
 - Assign each block of the copolymer to a property.
 - **Draw** a micelle scheme of **9:A-B-C** using only 4 polymer chains.

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example of these is [2]catenane, a molecule consisting of two interlocked rings (מבעות משורשרות). In this system, one macrocycle contains a single phenanthroline (a bidentate ligand) and the other contains two ligands: phenanthroline and terpyridine (a tridentate ligand). A single copper ion is coordinated by 2 ligands, one ligand from each macrocycle.

Depending on the oxidation state of the copper (+I or +II), two configurations are obtained (Fig. 1).

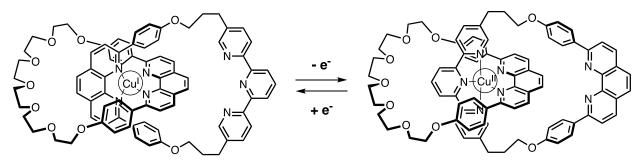

Fig. 1 – Multi-stability of a ring in a [2] catenane (Charges of the complexes are not shown)

The synthesis of the macrocycle is as follows:

1.	<u>Draw</u> the structure of B .
В	
2.	<u>Draw</u> the structures of E , F and G .
E	
F	
G	
3.	Out of the following reaction anditions, abong which and(s) can produce E from D.
J.	Out of the following reaction conditions, choose which one(s) can produce E from D :
	H^+ , H_2O
	OH^- , H_2O
	NaBH ₄ , CH ₃ OH H ₂ , Pd/C, THF
	112, 1 0 0, 1111
4.	In the synthetic strategy, MsCl is used to obtain:
	a leaving group
	a protecting group
	a directing group

5. **G** is obtained by the reaction between **F** and LiBr in acetone. This reaction is:

☐ electrophilic aromatic substitution	
□ nucleophilic aromatic substitution	
\square S _N 1	
\square S _N 2	

6. <u>Draw</u> the transition state of the rate-determining step of the reaction $\mathbf{F} \to \mathbf{G}$, showing the 3D geometry. Show only one reaction center. The main carbon chain can be represented as an R group.

6 "I"
Transition state:

The synthesis of [2] catenane L uses the template effect of a copper complex:

7. <u>Write</u> the full electronic configuration of metallic Cu(0) in its ground state. <u>Give</u> the oxidation state of Cu in complex J and <u>write</u> the electronic configuration of Cu in the free ion corresponding to J .
Electronic configuration of Cu(0):
Oxidation state of Cu in J :
Electronic configuration of Cu in J:
 8. Select the geometry of the copper ion in L.
 Assuming an ideal geometry of the ligands around the copper center, <u>draw</u> the electronic levels of the d orbitals subject to the crystal field.
• <u>Fill</u> the orbital diagram.
• <u>Give</u> the highest possible value of the spin (S) for this complex.
The geometry of Cu in L is: ☐ Octahedral ☐ Tetrahedral ☐ Square planar ☐ Trigonal bipyramid Splitting and filling of d orbitals:
S =
9. Out of the following compounds, <u>choose</u> the one(s) that can remove the copper ion in L to obtain the free [2]catenane:
☐ CH ₃ CN ☐ NH ₄ PF ₆ ☐ KCN ☐ tren

In [2]catenane **L**, the copper ion can exist in two oxidation states: (+I) or (+II), and each of them shows a different coordination sphere (tetra- or penta-coordinated, respectively).

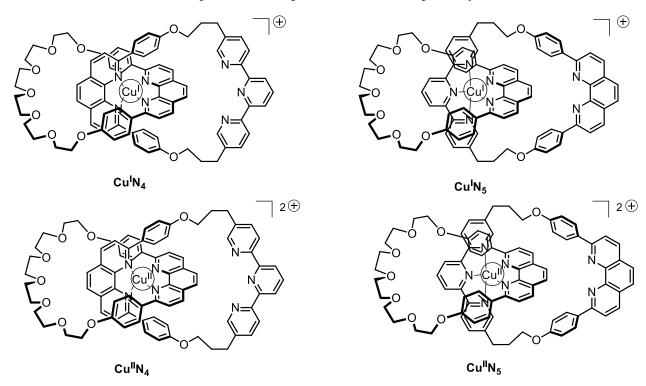

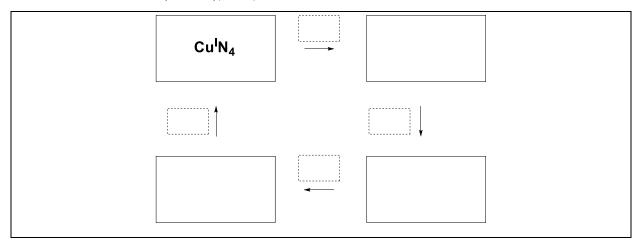

Fig. 2 – [2] catenane L states

The stability of Cu(I) complexes can be understood by comparing their electronic structures to that of a noble gas (גז אציל).

10. **Fill** in the blanks with a number or a tick:

The Cu ^I N ₄ complex has electrons in the coordination sphere of the metal.
The Cu^IN_5 complex has electrons in the coordination sphere of the metal.
The Cu^IN_4 complex is \square more $/$ \square less stable than the Cu^IN_5 complex.

11. <u>Fill</u> in the solid boxes with the designation of the involved complexes in **Fig. 2** and <u>complete</u> the sequence to achieve electrochemical control of the system using the following notation for the dashed boxes: (rotation); $+ e^-$; $- e^-$.

Problem T8: Identification and synthesis of inositols

In this problem, we define " $\underline{3D}$ structure" and " $\underline{perspective}$ formula" as indicated for β -glucose in the following figure.

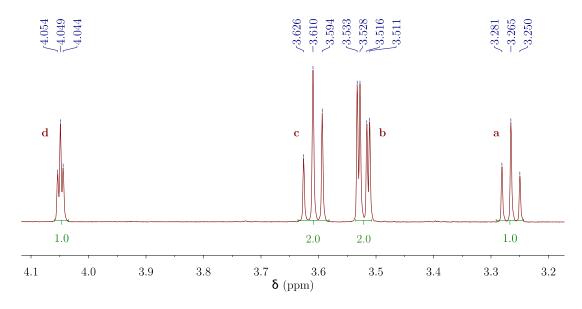

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular *myo*-inositol, are involved in a number of biological processes.

Structure of myo-inositol

1. <u>Draw</u> the structural formula of inositols, <u>without</u> stereochemical details.	
This family of molecules contains 9 different stereoisomers, including enantiomers.	
2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active.	

The structure of a specific inositol, called *myo*-inositol, is studied here.

- Only one of its chair conformers is predominant (עיקרי) and its structure can be deduced from its ¹H NMR spectrum.
- The spectrum below was obtained at 600 MHz in D₂O
- No other signal from that compound was observed in the spectrum.
- The integration is indicated on the spectrum below each signal.

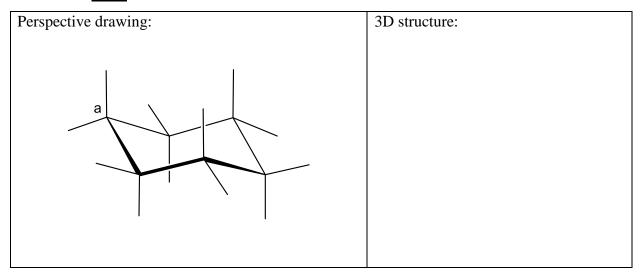

3. <u>Give</u> the molecular formula of the predominant compound derived from *myo*-inositol in this sample, that is consistent with the number of protons observed in the ¹H NMR spectrum.

4. Based on the number and integrations of the proton signals, **give** the number of symmetry plane(s) that exist(s) in this molecule.

5.

- <u>Complete</u> the provided "perspective drawing" for the most stable conformation of *myo*inositol.
- Then <u>label</u> each hydrogen with the corresponding letter (a, b, c or d) according to the NMR spectrum above. Proton a must be on carbon a on the provided representation.
- **Draw** its "3D structure".

Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. <u>Choose</u> the correct structural relationship(s) between 2 and 3.

□ er	nantiomers
□ e _I	pimers
□ di	iastereomers
□ at	tropoisomers

Inositol 2 can be obtained from compound 1 in 7 steps:

7. **Draw** the 3D structure of **4**.

4	4		

- 8. The reaction leading to **5** occurs on the double bond with the highest electron density. Consider below the structure of 1-bromo-1,3-cyclohexadiene, which is a substructure of **4**.
 - <u>Circle</u> the double bond with the highest electron density.
 - On separate structures, <u>represent</u> all the electronic effects of the bromine on the molecule (ציירו את כל האפקטים האלקטרוניים של ברום על המולקולה, בציורי מבנים נפרדים)

9. <u>Draw</u> the 3D structure of the major diaster	reomer 5.
5	
10. <u>Give</u> the total number of stereoisomers starting from enantiopure compound 1 .	of 5 possibly obtained (שניתן לקבל) by this synthesis,
11. For the step 5 → 6, another product wind produced. <u>Draw</u> the 3D structures of 6 and	th the same molecular formula, marked as 6', can be 16'.
6	6'
12. <u>Draw</u> the 3D structures of major diastereo	mers 8 and 9.
8	9
13. Select the right set(s) of conditions A to obtain	otain 2.
☐ H ₂ , Pd/C ☐ K ₂ CO ₃ , HF	
☐ K ₂ CO ₃ , HF ☐ HCOOH, H ₂ O	
\square BF ₃ ·OEt ₂	

14.	If the bromine is not present in compound 1, in addition to 2, another stereoisomer would be obtained.
	Considering that the stereoselectivity of the reactions that take place in the synthesis remains unchanged and that the following steps involve the same number of equivalents as for 2, <u>draw</u> the 3D structure of this stereoisomer and <u>give</u> its relationship with 2.
	enantiomers
	epimers
	diastereoisomers
	atropoisomers
15.	During the synthesis of 2 from 1, choose the step(s) that involve(s) removal of protecting or directing groups.
	$1 \rightarrow 4$
	$4 \rightarrow 5$
	$5 \rightarrow 6$
	$6 \rightarrow 7$
	$7 \rightarrow 8$

Problem T9: Synthesis of levobupivacaine

Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

L-Lysine hydrochloride

1. <u>Assign</u> the absolute configuration of the stereogenic center (מרכז כירלי) in L-lysine hydrochloride and <u>justify</u> your answer by classifying the substituents in order of their priority.

Configuration:	Priority $1 > 2 > 3 > 4$:				
$\square R$	NH ₃ ⁺ CI	444 NH3+	NAMO COO	NAME H	

2. The prefix L in L-lysine refers to relative configuration. **Choose** all correct statements:

All natural L-amino acids are levorotatory.
Natural L-amino acids can be levorotatory or dextrorotatory.
All natural L-amino acids are (S).
All natural L-amino acids are (R) .

Often, we want only one of the amino groups in L-lysine to react. A Cu^{2+} salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed NH_2 group is available to react.

3. Considering that L-lysine acts as a bidentate ligand and that two L-lysines coordinate to one Cu²⁺ ion in the presence of aqueous hydroxide, **draw** the structure of the intermediate complex.

Complex

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without Cu²⁺ salt.

$$\begin{array}{c} \text{Cl}^- \\ \text{H}_3 \\ \text{L-Lysine} \\ \text{hydrochloride} \\ \end{array} \begin{array}{c} \text{1) 1 eq. LiOH} \\ \text{2) 1 eq. PhCHO} \\ \end{array} \begin{array}{c} \text{A} \\ \end{array} \begin{array}{c} \text{1) NaOH, Cbz-Cl} \\ \text{2) diluted HCl} \\ \text{3) aqueous buffer} \\ \text{pH 6.2} \\ \end{array} \begin{array}{c} \text{B} \\ \text{C}_{14} \\ \text{H}_{20} \\ \text{N}_{2} \\ \text{O}_{4} \\ \end{array} \\ \end{array} \begin{array}{c} \text{NaNO}_{2}, \text{NaOAc} \\ \text{AcOH} \\ \text{C}_{16} \\ \text{H}_{21} \\ \text{NO}_{6} \\ \end{array} \begin{array}{c} \text{C} \\ \text{NH}_{2} \\ \text{DCC} \\ \end{array} \begin{array}{c} \text{D} \\ \text{1) K}_{2} \\ \text{CO}_{3}, \\ \text{H}_{2} \\ \text{2) TsCl, NEt}_{3} \\ \end{array} \begin{array}{c} \text{E} \\ \text{C}_{29} \\ \text{H}_{34} \\ \text{N}_{2} \\ \text{O}_{6} \\ \end{array} \\ \begin{array}{c} \text{AcO} \\ \text{AcO} \\ \text{C}_{18} \\ \text{H}_{28} \\ \text{N}_{2} \\ \end{array} \begin{array}{c} \text{C}_{18} \\ \text{H}_{28} \\ \text{N}_{2} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{C}_{18} \\ \text{H}_{28} \\ \text{N}_{2} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-Cl} \\ \text{Chz-Cl} \\ \end{array} \begin{array}{c} \text{Chz-$$

From this point on, you can use the abbreviations proposed in the scheme above.

4. <u>Draw</u> the structure of compound **A**, including the appropriate stereochemistry.

5.	Transformation of L-lysine into A is (choose proper answer(s)):
	an enantioselective reaction.
	an enantiospecific reaction.
	a regioselective reaction.

 \mathbf{A}

6. $\underline{\mathbf{Draw}}$ the structures of compounds \mathbf{B} - \mathbf{F} , including the appropriate stereochemistry.	
B C ₁₄ H ₂₀ N ₂ O ₄	C C ₁₆ H ₂₁ NO ₆
D	E C ₂₉ H ₃₄ N ₂ O ₆ S
F C ₂₁ H ₂₈ N ₂ O ₄ S	
7. What is the role of DCC in the transformation	$\mathbf{C} \to \mathbf{D}?$
 □ Protecting group for the amino group. □ Protecting group for the hydroxy group. □ Activating agent for the amide bond formation. 	
8. TsCl is used in the synthesis to enable:	
 □ Nucleophilic substitution of an amino group. □ Electrophilic substitution of an amino group. □ Nucleophilic substitution of a hydroxy group. □ Electrophilic substitution of a hydroxy group. 	

9. Mark all possible reagents which could be used as reagent H:		
	$\begin{array}{ccc} \text{diluted HCl} & \qquad & \square \text{ Zn/HCl} \\ \text{K}_2\text{CO}_3 & \qquad & \square \text{ H}_2\text{SO}_4 \\ \text{diluted KMnO}_4 & \qquad & \square \text{ diluted NaOH} \\ \text{SOCl}_2 & \qquad & \square \text{ PCl}_5 \end{array}$	
10.	<u>Draw</u> the structure of levobupivacaine, including the appropriate stereochemistry.	
Levobupivacaine C ₁₈ H ₂₈ N ₂ O		
Part II. The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of aminoacids is their transformation into amides using Mosher's acid (see the structure of its (<i>S</i>) isomer below).		
	HO (S)	
	(S)-Mosher's acid	
11.	Draw the structure of the amide formed when the α -amino group of L-lysine is derivatized (מגיבה) with (S)-Mosher's acid. Clearly show the stereochemistry of each chiral center.	
12.	<u>How many products</u> will be formed from racemic lysine and (S)-Mosher's acid (consider that only the α-amino group of lysine is derivatized)?	
	Two diastereoisomers. Four diastereoisomers.	
	A racemic mixture of two enantiomers. Four compounds: two enantiomers and two diastereoisomers.	
13.	$\underline{\textbf{Choose}}$ the method(s) that can be used to quantitatively determine the enantiomeric purity (לקבוע כמותית מה הניקיון האופטי) of lysine after its derivatization with (S)-Mosher's acid:	
	NMR spectroscopy. Liquid chromatography. Mass spectrometry. UV-vis spectroscopy.
