THEORETICAL EXAM

51st — International Chemistry Olympiad France — Paris — 2019

Making science together!

2019-07-26

MINISTÈRE DE L'ÉDUCATION NATIONALE ET DE LA JEUNESSE

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR, DE LA RECHERCHE ET DE L'INNOVATION

General instructions

- This theoretical exam booklet contains 63 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective designed areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designed areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30-minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by ½ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

GOOD LUCK!

Table of Contents

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

Problem T1: Infinite well and butadiene	(6%)	p. 8
Problem T2: Hydrogen production by water-splitting	(7%)	p. 13
Problem T3: About silver chloride	(5%)	p. 19
Problem T4: From gunpowder to the discovery of iodine	(7%)	p. 24
Problem T5: Complexes for the formation of nanomachines	(8%)	p. 30
Problem T6: Characterization of a block-copolymer	(8%)	p. 39
Problem T7: Ring motion in a [2]catenane	(6%)	p. 48
Problem T8: Identification and synthesis of inositols	(6%)	p. 53
Problem T9: Synthesis of levobupivacaine	(7%)	p. 58

Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in mol L⁻¹. To further simplify formulas and expressions, the standard concentration $c^{\circ} = 1 \text{ mol } L^{-1}$ is omitted.

Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written CH_2 =CH-CH= CH_2 , with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the π electrons are better described by a distribution along the three bonds:

This system can be modeled as a 1D box (*i.e.* infinite well) where the electrons are free. The energy of an electron in an infinite well of length L is: $E_n = \frac{n^2 h^2}{8m_e L^2}$, where n is a **non-zero** positive integer.

1. Two different models are studied. <u>Sketch</u> at least the three lowest-energy levels E_n <u>for each model</u> in the respective diagrams, showing how the relative energy levels differ within and between models.

Model 1 (« **localized** »): The π electrons are localized on the extremal bonds and evolve in two separate infinite potential wells of length d.

Model 2 (« delocalized »): The π electrons are delocalized on the whole molecule and evolve in a single infinite potential well of length 3d.

2. Place the π electrons for model 1 in the previous diagrams and express the total energy the π system in model 1, as a function of h , m_e and d .	ergy of				
E(1) =					
3. Place the π electrons for model 2 in the previous diagrams and express the total energy the π system in model 2, as a function of h , m_e and d .	ergy of				
E(2) =					
The conjugation energy is the total energy of the actual π system, minus the sum energies of ethylene molecules involving the same number of electrons.	of the				
4. Express the conjugation energy ΔE_c of butadiene, as a function of h , m_e and d .					
$\Delta E_{\rm c} =$					
Models 1 and 2 are too simplistic. A new model will be detailed in the following.					
5. <u>Draw</u> three other resonance structures of butadiene using Lewis notation.					
H_2C CH_2					

To take into account the size of carbon atoms, model 2 is now modified into model 3, as follows:

- the new length of the well is L and is located between 0 and L;
- the carbon atoms are located at the abscissas L/8; 3L/8; 5L/8 and 7L/8.

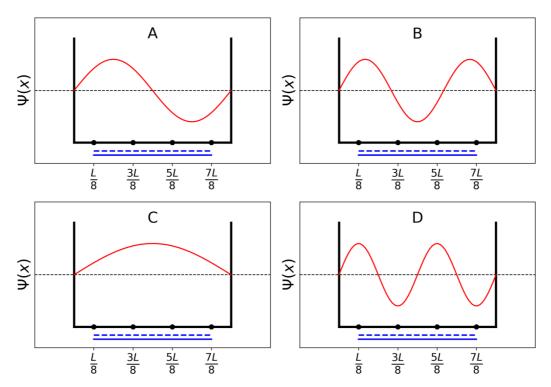

For each level n, the π wavefunction is:

$$\psi_{\rm n}(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$$

and the π electron density for a system with $N\pi$ electrons is:

$$\rho(x) = 2 \sum_{i=1}^{N/2} |\psi_i(x)|^2$$

The four π wavefunctions, which correspond to the molecular orbitals of the π system, are depicted below (arbitrary order).

6. **Sort** the energies of the four π wavefunctions (E_A , E_B , E_C and E_D).

< < <

7. Give the labels (A, B, C or D) of the orbitals that are filled with electrons in butadie	iene
---	------

8. Within model 3, <u>give</u> the values of the π wavefunctions ψ_n for occupied levels at positions 0, L/4 and L/2, for n = 1 and n = 2, as a function of L.

 $\psi_1(0) =$

 $\psi_1\left(\frac{L}{4}\right) =$

 $\psi_1\left(\frac{L}{2}\right) =$

 $\psi_2(0) =$

 $\psi_2\left(\frac{L}{4}\right) =$

 $\psi_2\left(\frac{L}{2}\right) =$

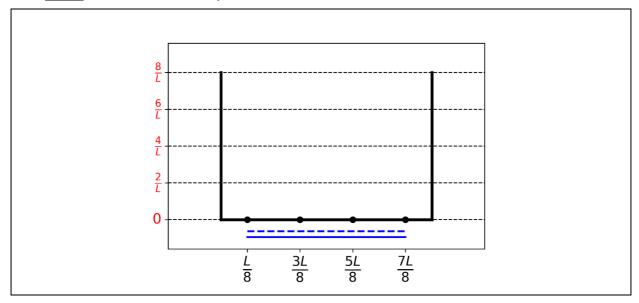

9. Within model 3, give the value of the π electron density at positions 0, L/4 and L/2.

$$\rho(0) =$$

$$\rho\left(\frac{L}{4}\right) =$$

$$\rho\left(\frac{L}{2}\right) =$$

10. **Draw** the π electron density between 0 and L.

11. <u>Sort</u> the following CC bonds (B1, B2, ..., B5) by increasing bond length, using the symbols

= or <:

B1: C1C2 in the butadiene molecule
B2: C2C3 in the butadiene molecule
B3: C3C4 in the butadiene molecule

B4: CC in the ethane molecule B5: CC in the ethene molecule

Problem T2: Hydrogen production by water-splitting

Data:

Compound	$H_2(g)$	H ₂ O(1)	$H_2O(g)$	$O_2(g)$
$\Delta_{\rm f}H^{\circ}~({\rm kJ~mol}^{-1})$	0	-285.8	-241.8	0
$S_{\rm m}^{\circ} ({\rm J~mol}^{-1} {\rm K}^{-1})$	130.6	69.9	188.7	205.2

Molecular hydrogen (H_2) can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1.	<u>Write</u> the balanced equation of liquid water splitting reaction <u>using a stoichiometric coefficient of 1 for water</u> .
2.	Using only the provided thermodynamic data, justify numerically whether this reaction is thermodynamically favorable at 298 K.
Ca	lculations:
D.a	action the among demandically for each less
Ke	action thermodynamically favorable?
	□ Yes □ No

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected by a generator (Fig. 1). Gas bubbles are formed at both electrodes.

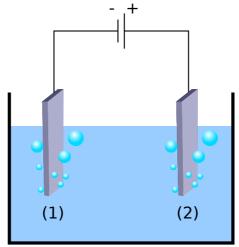

Fig. 1 – Water-splitting electrochemical cell.

3. Write the balanced half reactions occurring at each electrode.

On electrode (1):
On electrode (2):

4. Using only the provided thermodynamic data (or question 2), <u>derive</u> the condition on the applied voltage between electrodes $\Delta E_{\text{applied}}$ compared to the value ΔE_{th} (to be calculated) for the process to be thermodynamically favorable at 298 K, when all reactants and products are in their standard state. <u>Tick</u> the right condition and <u>give</u> the numerical value to 3 decimal places.

Calculation:

- $\Box \quad \Delta E_{\text{applied}} = \Delta E_{\text{th}}$
- \Box $\Delta E_{\text{applied}} > \Delta E_{\text{th}}$

 $\Delta E_{\text{th}} = \dots V$ (give the result to 3 decimal places)

 \Box $\Delta E_{\text{applied}} < \Delta E_{\text{th}}$

If you could not calculate ΔE_{th} , the value 1.200 V can be used in the rest of the problem.

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting, ΔE_{\min} , depends on the nature of the anode, as displayed in the table below:

Anode	$\Delta E_{\min}(V)$
IrO_x	1.6
NiO_x	1.7
CoO_x	1.7
Fe_2O_3	1.9

The difference between ΔE_{\min} and ΔE_{th} is responsible for losses in the device.

5. <u>Give</u> the expression of the device power efficiency η_{elec} (fraction of the power used for water splitting) as a function of ΔE_{th} and ΔE_{min} . Assuming that the current supplied is constant, <u>calculate</u> the water electrolysis power efficiency when a Pt cathode and a Fe₂O₃ anode are used. <u>Give</u> the most efficient anode.

22	٠.		_
,,,	\sim	00	_

Power efficiency when a Pt and a Fe₂O₃ electrodes are used:

$$\eta_{
m elec} = \%$$

Most efficient anode:

If you could not calculate η_{elec} , the value $\eta_{elec} = 75\%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

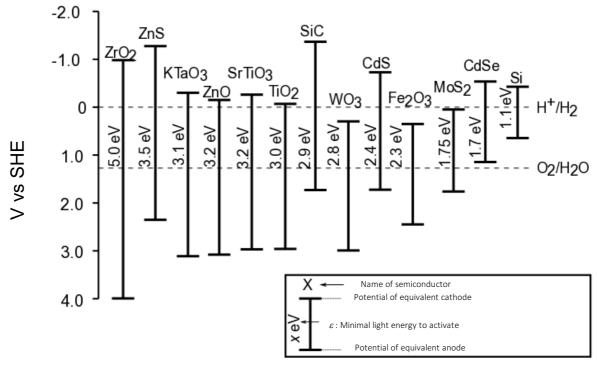

Fig. 2 – Activation condition and equivalent electrode potentials of different semiconductors.

Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard

Hydrogen Electrode

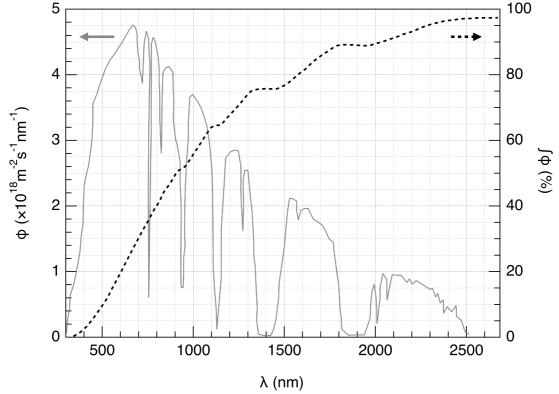

Fig. 3 – Left axis: Spectral distribution of the solar photon flux ϕ . The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with smaller wavelength).

6.	Estimate the semiconductors: calculation.

8.	Give the semicon efficient for water					de and	l anode	e, is	expe	cted to	be t	the n	nost

The evolution of H_2 and O_2 when a semiconductor is irradiated by simulated solar light at T = 25 °C and p_{atm} (atmospheric pressure) was recently studied. Using an incident power light of $P = 1.0 \text{ kW m}^{-2}$ and a photoelectrode with a surface area of $S = 16 \text{ mm}^2$, the production of $V = 0.37 \text{ cm}^3$ of $H_2(g)$ was measured after $\Delta t = 1$ hour of reaction.

9. <u>Calculate</u> the power e	efficiency $\eta_{ ext{direct}}$ of the cor	nversion.
Calculation:		
	0./	
$\eta_{ m direct}$ =	%	
If yo	ou could not calculate $\eta_{ ext{direct}}$ can be used in the rest of	
photocatalysis, and indirectoryzer. The efficience	rect photo-electrolysis c ey of photovoltaic panels of	ydrogen can thus be compared: direct ombining a photovoltaic panel with an on the market is around $\eta_{\text{panels}} = 20\%$.
10. Calculate and compa Fe ₂ O ₃ and Pt electrode		of the two modes, $\eta_{ ext{direct}}$ and $\eta_{ ext{indirect}}$, using
Calculation:		
\square $\eta_{ ext{direct}} > \eta_{ ext{indirect}}$	\square $\eta_{ ext{direct}} pprox \eta_{ ext{indirect}}$	$\ \ \square \ \eta_{ m direct} < \eta_{ m indirect}$

Problem T3: About silver chloride

Data at 298 K:

 $pK_{s1}(AgCl) = 9.7$; $pK_{s2}(Ag_2CrO_4) = 12$

Formation constant of the complex $[Ag(NH_3)_n]^+$: $\beta_n = 10^{7.2}$

Potentials against the standard hydrogen electrode:

Standard potential of $Ag^{+}/Ag(s)$: $E^{\circ}(Ag^{+}/Ag(s)) = 0.80 \text{ V}$

Apparent potential of $O_2(aq)/HO^-(aq)$ (in seawater): $E'(O_2(aq)/HO^-(aq)) = 0.75 \text{ V}$

Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778–1850) deal with some properties of silver chloride.

Quote A: "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."

Quote B: "This salt has no taste since it is insoluble."

Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."

Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."

Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."

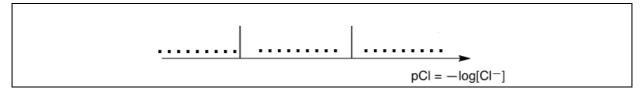

Quote F: "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

Ι.	Quote A:	Write t	the balance	d chemical	equation	for the	synthesis	of A	gCl(s)).

2. **Quote B:** Calculate the solubility s of AgCl(s) in water at 298 K in mol L^{-1} .

Calculation:		
	$_{S} =$	$\operatorname{mol} \operatorname{L}^{-1}$

3. **Quote C:** In a highly concentrated solution of chloride ions, a well-defined complex with stoichiometry of 1:2 is formed. On the following qualitative axis (with pCl increasing from left to right), **place** in each domain the silver-containing species that is predominant (or exists, for solids). pCl values at boundaries are not expected.

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry n is formed.

4. Write the balanced equation corresponding to the synthesis of the complex $[Ag(NH_3)_n]^+$ from silver chloride and <u>calculate</u> the corresponding equilibrium constant.

Equation:	
Calculation:	
	K =
	If you could not calculate K , the following value can be used in the rest of the problem: $K = 10^{-3}$
	can be used in the rest of the problem: $K = 10^{-3}$

5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears. At this moment, $[NH_3] = 1.78 \text{ mol } L^{-1}$. Neglecting dilution effects, <u>determine</u> the stoichiometry of the complex.

Calculation:	
	n —
	<i>n</i> =

6.	<u>Write</u> the balanced chemical equation corresponding to quote E.
7.	Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions, <u>write</u> a balanced chemical equation corresponding to the formation of the solid mentioned in quote F. A stoichiometric coefficient of 1 will be chosen for dioxygen. <u>Calculate</u> its equilibrium constant at 298 K.
Equ	uation:
Cal	culation:
	K =
	Λ -

Part B: The Mohr method

The Mohr method is based on the colorimetric titration of Cl⁻ by Ag⁺ in the presence of potassium chromate $(2K^+, CrO_4^{2^-})$. Three drops (~ 0.5 mL) of a K_2CrO_4 solution at about $7.76 \cdot 10^{-3}$ mol L⁻¹ are added to $V_0 = 20.00$ mL of a sodium chloride solution of unknown concentration C_{Cl} . This solution is then titrated by silver nitrate (Ag^+, NO_3^-) at $C_{Ag} = 0.050$ mol L⁻¹, which immediately leads to the formation of solid **A**. A red precipitate (solid **B**) appears at $V_{Ag} = 4.30$ mL.

8.	<u>Write</u> the balanced equations of the two reactions occurring during the experiment. <u>Calculate</u> the corresponding equilibrium constants.
	$K^{\circ}{}_{1}=$
	$K^{\circ}{}_{2}$ =
9.	<u>Identify</u> the solids.
	Solid A:
	Solid B :
10.	$\underline{Calculate}$ the unknown concentration C_{Cl} of chloride ions in the sodium chloride solution.
Cal	culation:
	$C_{\rm Cl} = \mod \mathrm{L}^{-1}$
	If you could not calculate $C_{\rm Cl}$, the value $C_{\rm Cl} = 0.010 \ {\rm mol} \ {\rm L}^{-1}$ can be used in the rest of the problem.
11.	<u>Calculate</u> the minimal volume $V_{Ag}(min)$ for which AgCl(s) precipitates.
Cal	culation:

$V_{\text{Ag}}(\min) =$		mL	
12. <u>Calculate</u> the residual concentration to precipitate. <u>Justify</u> why CrO ₄ ²⁻ is values.	[Cl ⁻] _{res} of chl a good titration	oride ions when on endpoint indi	silver chromate begins cator by comparing two
Calculation:			
	$[Cl^-]_{res} =$		$mol L^{-1}$

Problem T4: From gunpowder to the discovery of iodine

In the 19^{th} century, the French entrepreneur B. Courtois specialized in the production of nitrate \mathbf{A} ($\mathbf{M}_{\mathbf{A}}(\mathrm{NO}_3)_m$), used for gunpowder. Initially imported from Asia, \mathbf{A} was later produced from nitrate \mathbf{B} ($\mathbf{M}_{\mathbf{B}}(\mathrm{NO}_3)_n$) using exchange reaction with compound \mathbf{C} , obtained from algae.

1.	<u>Find</u> the formulae of nitrates A and B knowing that they are anhydrous salts of alkaline or alkaline-earth metal (M_A and M_B). One of the nitrates contains no more than 1 w% of non-metallic impurities while the other contains 9 ± 3 w% of impurities. The content of metals M_A and M_B in the samples is 38.4 w% and 22.4 w% respectively. <u>Support</u> your answer with calculations.
	\mathbf{A} : and \mathbf{B} :

To obtain **A**, 262.2 g of solid compound **C** were added to the solution containing 442.8 g of **B**. **B** is known to be in excess. As a result, 190.0 g of white precipitate **D** were formed and removed by filtration. The filtrate was evaporated, and the obtained solid mixture **E** was heated until the mass of the sample (containing only nitrites, NO_2^-) was constant. The only gaseous product was dioxygen: 60.48 L at 0 °C at 1 atm (dioxygen can be considered as an ideal gas).

2.	<u>Calculate</u> the composition (in w% compounds A and B and no other state.	6) of mixture E consi impurities, and that C	dering th was take	at it contained only n in pure anhydrous
		w% of A :	and of	B :

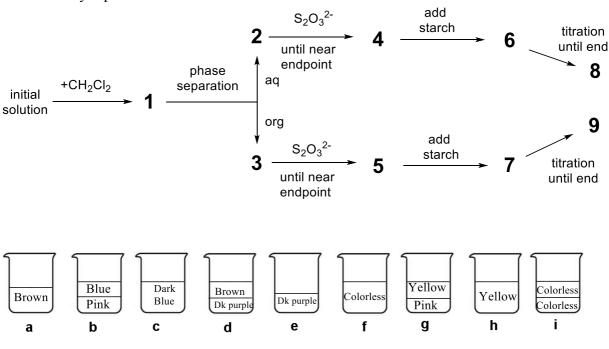

3.	$\underline{Determine} \text{ the formulae of compounds } C \text{ and } D \text{ and } \underline{write} \text{ the balanced equation for the reaction between } B \text{ and } C.$
	C: and D:
Rea	action between B and C :
fasi spii can disc me	1811, when working with algae ashes, Courtois observed that copper vessels were worn out ter than usual. While he was studying this phenomenon, his cat entered the laboratory and lled the solution of concentrated sulfuric acid on the dry algae ashes: violet vapors instantly ne out of the vessel (1, sulfuric acid is the oxidizing agent): iodine (I_2) had just been covered! Iodine was the cause of the copper corrosion (2). However, because of the dicinal applications of iodine, Courtois opened a new manufacture to produce it by ction of algae with chlorine (3).
	wadays, iodine is prepared from the set of reactants (NO_3^-, Γ, H^+) (4) or (IO_3^-, Γ, H^+) (5).
4.	Write balanced equations for reactions 1–5.

5	
<u> </u>	

The solubility of iodine is very low in water but significantly increases when iodide ions are added. Together they form ions such as triiodide, I_3^- :

$$\Gamma(aq) + I_2(aq) = I_3(aq)$$
 (6)

Equilibrium (6) can be studied through the extraction of I_2 with dichloromethane. Indeed, I^- and I_3^- do not dissolve in organic solvents but I_2 does and, when extracted, it is 15 times more concentrated in dichloromethane than in water.

The following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide (0.1112 g). Then, 50.0 mL of dichloromethane were added, and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated by 16.20 mL (organic phase) and by 8.00 mL (aqueous phase) of the standard aqueous solution of sodium thiosulphate pentahydrate (14.9080 g in 1.000 L of solution) in the presence of starch. The process is schematically represented below:

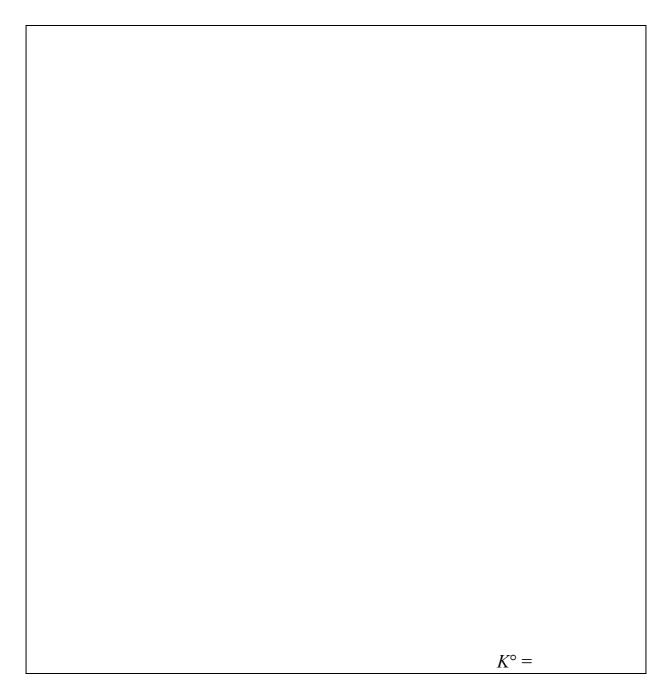

5. <u>Find</u> the correspondence between the stages on the scheme (1–9) and the schematic pictures representing them (a–i).

Problem T5: Azobenzene – β -cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of an energy source into a nano-movement for applications such as drug delivery. Numerous nanomachines make use of the isomerization of azo compounds (R–N=N–R') upon irradiation.

1. <u>Draw</u> the stereoisomers of azobenzene ($H_5C_6-N=N-C_6H_5$) and <u>draw</u> a line between the two carbon atoms that are the furthest apart. <u>Compare</u> these two distances (d_{trans} and d_{cis}).

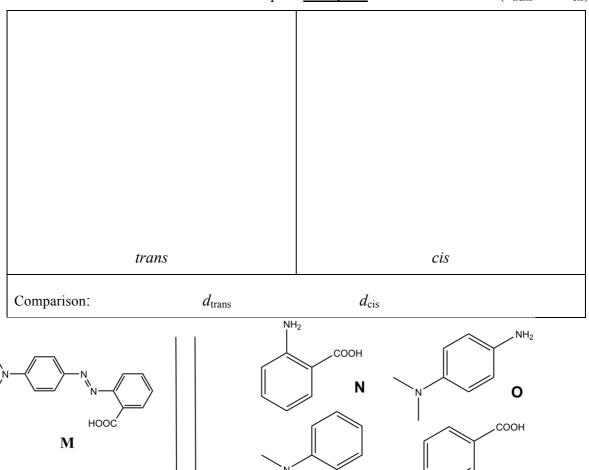

Fig. 1 – Possible reactants for the synthesis of M.

2. **M** can be synthesized in two steps from simple reactants (Fig. 1). <u>Choose</u> among the suggested reactants (N to N) the ones that can provide N with very high regionselectivity. Sodium nitrite ($NaNO_2$) in cold aqueous hydrochloric acid is used as reagent for the first step of the synthesis.

Reactants:	and	

Q

Determination of the association constant K_t

 β -cyclodextrin (C, Fig. 2) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In tasks 3 to 6, we will determine by spectroscopy the association constant K_t , corresponding to the formation of the inclusion complex CM_{trans} as depicted in Fig. 2.

$$K_{t}$$
 K_{t}
 K_{t

Fig. 2 – Formation of the CM_{trans} inclusion complex.

Several solutions are prepared by mixing C and M_{trans} in different proportions to reach initial concentrations $[C]_0$ and $[M_{trans}]_0$. For all solutions, $[M_{trans}]_0$ is kept constant and $[C]_0$ is varied. We follow, at a fixed wavelength, the evolution of the difference in absorbance ΔA between the absorbance of each solution and the pure M_{trans} solution. We note the molar absorption coefficients of CM_{trans} and M_{trans} , $\varepsilon_{CMtrans}$ and ε_{Mtrans} , respectively. L is the path length of the beam through the sample. The absorbance of C (ε_{C}) is negligible.

3. Show that $\Delta A = \alpha \cdot [CM_{trans}]$ and express α in terms of known constant(s).

Answer:	
	~ -
	$\alpha =$

4.	Show that, when C is in large excess with respect to M_{trans} (i.e. $[C]_0 >> [M_{trans}]_0$), the concentration of C may be considered as constant, $[C] \simeq [C]_0$.
An	swer:
5.	Show that, when C is in large excess with respect to M_{trans} (i.e. $[C]_0 >> [M_{trans}]_0$),
٥.	
	$\Delta A = \alpha \cdot \frac{\beta \cdot [C]_0}{1 + K_t \cdot [C]_0}$ and <u>express</u> β in terms of constant(s) and initial concentration(s).
An	swer:
	$oldsymbol{eta} =$
	r

6. **Determine** K_t using the following experimental curve (Fig. 3).

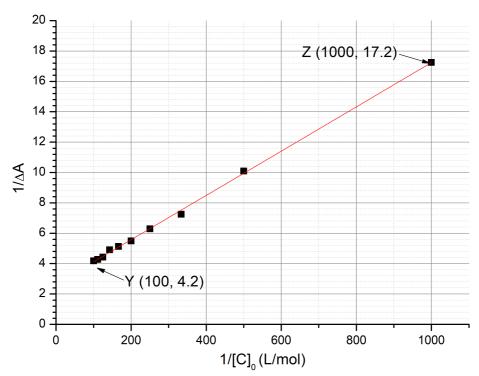

Fig. 3 – Evolution of $1/\Delta A$ as a function of $1/[C]_0$.

Calculations:	
	T.7
	$K_{\rm t} =$

Determination of the association constant K_c

In tasks 7 to 9, we will determine the association constant K_c , corresponding to the formation of the inclusion complex $\mathbf{CM_{cis}}$, through kinetics studies.

A known amount of M_{cis} , $[M_{cis}]_0$, is produced by irradiating a sample containing only M_{trans} . M_{cis} (both as free molecular form or within the inclusion complex) can thermally isomerize into M_{trans} , as illustrated in Fig. 4 below.

In the absence of C, the isomerization follows a first order kinetics with a rate constant k_1 . Assume that all complexation equilibria are faster than the isomerization processes.

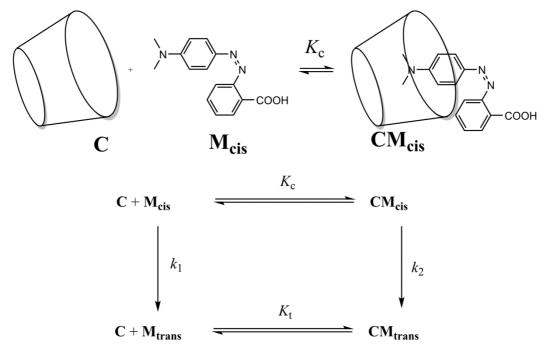

Fig. 4 – Kinetic scheme for the isomerization of M_{cis} in the presence of C.

The rate of disappearance r for the total amount of M_{cis} (free and complexed) is defined as

$$r = k_1[\mathbf{M_{cis}}] + k_2[\mathbf{CM_{cis}}]$$

Experimentally, r follows an apparent first order kinetic law with an apparent rate constant k_{obs} :

$$r = k_{\text{obs}}([\mathbf{M_{cis}}] + [\mathbf{CM_{cis}}])$$

7. **Show** that $k_{\text{obs}} = \frac{\gamma + \delta \cdot k_2[C]}{1 + K_C[C]}$ and **express** γ and δ in terms of known constant(s).

Answer:			

$\gamma =$	and	δ =

8. <u>Choose</u> in which condition(s) the half-life $t_{1/2}$ corresponding to k_{obs} can be expressed as $t_{1/2} = \frac{\ln 2}{\gamma} (1 + K_{\text{c}}[\mathbf{C}]_0)$ given that $[\mathbf{C}]_0 >> [\mathbf{M}_{\text{cis}}]_0$. Mathematically <u>justify</u> your answer.

П	Very slow	isomer	ization	of Maia	within	cyclodextrin

- \Box Very slow isomerization of free M_{cis}
- \Box CM_{cis} very stable
- \Box CM_{trans} very stable

Answer:

9. Assuming the condition(s) in task 8 is/are satisfied, <u>determine</u> K_c by a linear regression using the data below. You may use a calculator or plot a graph.

$[\mathbf{C}]_0 \text{ (mol L}^{-1})$	$t_{1/2}$ (s)	$[\mathbf{C}]_0 \text{ (mol L}^{-1})$	$t_{1/2}$ (s)
0	3.0	$3.0 \cdot 10^{-3}$	5.9
$1.0 \cdot 10^{-4}$	3.2	$5.0 \cdot 10^{-3}$	7.7
$5.0 \cdot 10^{-4}$	3.6	$7.5 \cdot 10^{-3}$	9.9
$1.0 \cdot 10^{-3}$	4.1	$1.0 \cdot 10^{-2}$	12.6

Formation of nanomachines

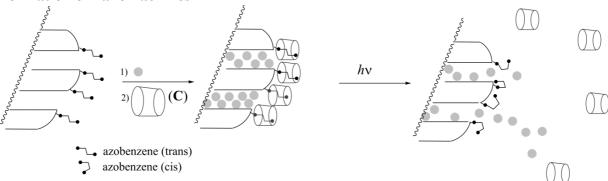

Fig. 5 – Cleavage of an azobenzene–cyclodextrin inclusion complex induced by a light-triggered isomerization, which allows delivery of a drug (grey circle).

Another azobenzene compound (for which $K_c \ll K_t$), initially in the *trans* form, is covalently grafted on silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, grey circles in Fig. 5). Upon addition of \mathbb{C} , an inclusion complex is formed, which blocks the pores and prevents the release of the dye.

10. <u>Choose</u> the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of **C**, and the dye can be released upon irradiation.

 $\begin{array}{ccc} & & K_t >> 1 \\ & & K_t >> 1 \text{ and } K_c << 1 \\ & & & K_t / K_c << 1 \\ & & & K_t >> 1 \text{ and } K_c >> 1 \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$

This azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that this powder cannot move into solution. The powder is irradiated at a wavelength λ_1 to trigger the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength λ_2 .

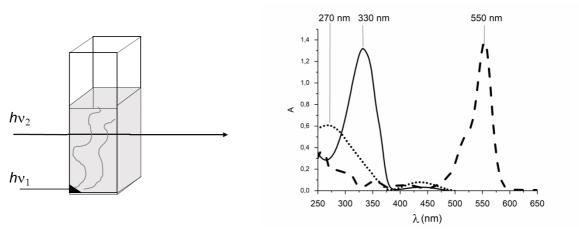

Fig. 6 – Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line) and rhodamine B (dashed line).

11. **Determine** λ_1 .

λ_1 =	nm

12. **Determine** λ_2 .

$\lambda_2 =$	nm

Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule are studied.

Study of the first block

In this first part, we will study the water-soluble homopolymer 1 (α -methoxy- ω -aminopolyethyleneglycol).

The ¹H NMR spectrum of 1 (DMSO- d_6 , 60 °C, 500 MHz) includes the following signals:

Index	δ (ppm)	Peak Area (A)
a	2.7*	0.6
b	3.3	0.9
c	3.4	0.6
d	~ 3.5	133.7

Table 1, *in the presence of D_2O , the signal at 2.7 ppm disappears.

1. <u>Match</u> the ¹H NMR signals (a, b, c, d) from Table 1 with each of the corresponding protons.

2. Express the average degree of polymerization, n, as a function of the area $A_{\rm OC2H4}$ of the NMR peak of the repeating unit and the area $A_{\rm OCH3}$ of the NMR peak of the methyl end group. Calculate n.

n =

If you could not calculate n, the value n = 100 can be used in the rest of the problem.

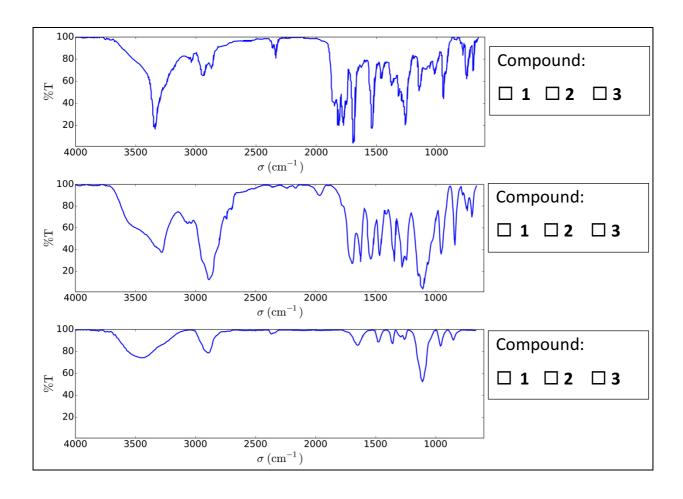

Study of a diblock-copolymer

The synthesis of the second block of the copolymer is performed through the reaction of 1 with 2 (ε -(benzyloxycarbonyl)-lysine N-carboxyanhydride). This yields the block-copolymer 3.

$$O = \begin{pmatrix} & & & & \\ & &$$

3. <u>Draw</u> the reaction intermediate that is formed in the first step of the reaction of 1 and 2. The second step of the mechanism leads to the formation of a gas molecule, G. <u>Draw</u> the structure of G.

4. Infrared (IR) measurements are performed to characterize the compounds. <u>Match</u> the three IR spectra with compounds 1, 2 and 3.

5. The ¹H NMR spectrum of copolymer **3** (in DMSO- d_6 , at 60 °C, 500 MHz) is reported in Fig. 1. Using some or all of the NMR signals, the areas of which are reported in Table 2, <u>calculate</u> its number average molar mass M_n , considering n from question 2. For your calculations, <u>draw</u> a circle around the group(s) of atoms you used and <u>give</u> their corresponding symbol(s) $(\alpha, \beta...)$.

$$H \longrightarrow \begin{pmatrix} 0 \\ N \\ H \end{pmatrix}_m \longrightarrow \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

 $M_{\rm n} = {\rm kg \ mol}^{-1}$ Provide your answer to two decimal places. This reaction of 1 with 2 yielded the copolymers 3a after 20 h, 3b after 25 h and 3c after 30 h of reaction at 40 °C. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

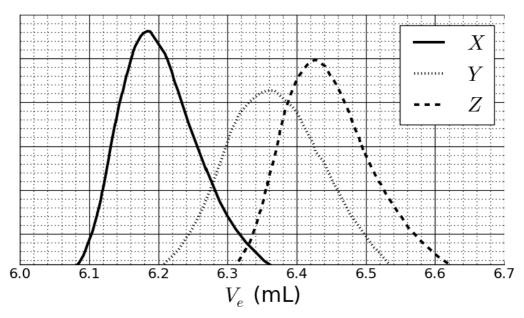

Fig. 2 – SEC chromatograms of 3a, 3b and 3c as a function of the elution volume, V_e .

6. Match the signals in Fig. 2 with the copolymers 3a, 3b and 3c.

3a:	$\square X$	$\square Y$	$\Box Z$	
3b:	$\square X$	$\square Y$	$\square Z$	
3c:	$\square X$	$\square Y$	$\square Z$	

In order to calibrate the chromatogram, a mixture of standard polymers of known masses (3, 30, 130, 700 and 7000 kg mol⁻¹) has been studied (Fig. 3).

The log value of the molar mass is a linear function of the elution volume, $V_{\rm e.}$

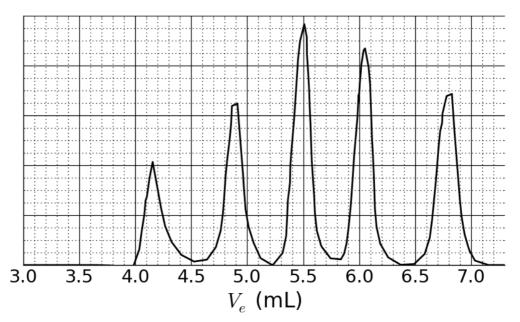

Fig. 3 – SEC chromatogram of the mixture of standards.

7. Based on the SEC curves in Fig. 2 and 3, <u>determine</u> V_e of the polymer that corresponds to curve X and use it to <u>estimate</u> the degree of polymerization m of its second block. <u>Detail</u> your calculation; you may use a calculator or plot a graph.

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated to one ligand from each macrocycle. Depending on the oxidation state of the copper (+I or +II), two configurations are obtained (Fig. 1).

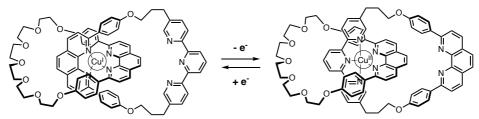

Fig. 1 – Multi-stability of a ring in a [2]catenane.

The synthesis of the macrocycle is the following:

1. **Draw** the structure of **B**.

В				

2.	<u>Draw</u> the structures of E, F and G.
E

Problem T8: Identification and synthesis of inositols

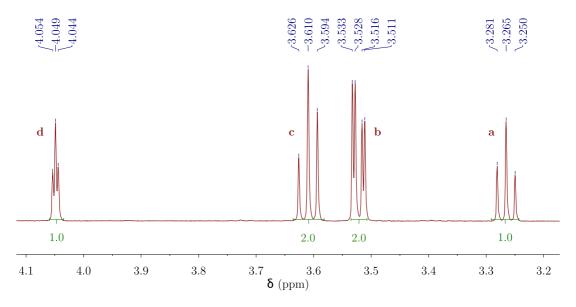

In this problem, we define " $\underline{3D}$ structure" and " $\underline{perspective}$ formula" as indicated for β -glucose in the following figure.

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular *myo*-inositol, are involved in a number of biological processes.

Structure of myo-inositol

1. <u>Draw</u> the structural formula of inositols. You do not need to show any stereochemical details.
This family of molecules contains 9 different stereoisomers, including enantiomers. 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active.

The structure of a specific inositol, called *myo*-inositol, is studied here. Only one of its chair conformers is predominant and its structure can be deduced from its ¹H NMR spectrum. The spectrum below was obtained at 600 MHz in D₂O. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. <u>Give</u> the molecular formula of the compound derived from *myo*-inositol in this sample that is consistent with the number of protons observed in the ¹H NMR spectrum.

4. Based on the number and integrations of the proton signals, **give** the number of symmetry plane(s) that exist(s) in this molecule.

5. <u>Complete</u> the following perspective drawing of the most stable conformation of *myo*-inositol. Then <u>label</u> each hydrogen with the corresponding letter (**a**, **b**, **c** or **d**) according to the ¹H NMR spectrum above. Proton **a** must be on carbon **a** on the following representation. <u>Draw</u> its 3D structure.

Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. <u>Choose</u> the correct structural relationship(s) between 2 and 3.

Inositol 2 can be obtained from compound 1 in 7 steps.

7.	<u>Draw</u> the 3D structure of 4.	
4		
8.	Consider the structure of 1-bromo-1,3-cyc	double bond with the highest electron density. Elohexadiene below, which is a substructure of electron density. On separate structures, show e.
	Br

Problem T9: Synthesis of levobupivacaine

Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

$$CI_{H_3N}^ NH_3^+$$
 O

L-Lysine hydrochloride

1. <u>Assign</u> the absolute configuration of the stereocenter in L-lysine hydrochloride and <u>justify</u> your answer by classifying the substituents in order of their priority.

Configuration:	Priority 1 > 2 > 3 > 4:	
$\square R$ $\square S$	NH ₃ ⁺ Cl ⁻ NH ₃ ⁺ COO ⁻	∀ ^H

2. The prefix L in L-lysine refers to relative configuration. **Choose** all correct statements:

- ☐ All natural L-amino acids are levorotatory.
- ☐ Natural L-amino acids can be levorotatory or dextrorotatory.
- \square All natural L-amino acids are (S).
- \square All natural L-amino acids are (R).

Often, we want only one .] of the amino groups in L-lysine to react. A Cu^{2+} salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed NH_2 group is available to react.

3.	Considering that L-lysine acts as a bidentate ligand and that two molecules of L-lysine coordinate to one Cu^{2+} ion in the presence of aqueous hydroxide, <u>draw</u> the structure of the intermediate complex.
Cor	nplex
L	

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without Cu²⁺ salt.

$$\begin{array}{c} \text{CI} \\ \text{H}_{3} \\ \text{N} \\ \text{L-Lysine} \\ \text{hydrochloride} \\ \end{array} \begin{array}{c} \text{1) 1 eq. LiOH} \\ \text{2) 1 eq. From this point on, you can use the abbreviations proposed in the scheme above.

4. **<u>Draw</u>** the structure of compound **A**, including the appropriate stereochemistry.

A	
5.	Select the appropriate answer(s): Transformation of L-lysine into A is
П	an enantioselective reaction.
_	
	an enantiospecific reaction.
	a regioselective reaction.

6.	Draw the structures o	f compounds B	-F , including	the appropriate	stereochemistry.
----	------------------------------	---------------	-----------------------	-----------------	------------------

$\mathbf{B} \mathrm{C}_{14} \mathrm{H}_{20} \mathrm{N}_2 \mathrm{O}_4$	C C ₁₆ H ₂₁ NO ₆						
D	E C ₂₉ H ₃₄ N ₂ O ₆ S						
F C ₂₁ H ₂₈ N ₂ O ₄ S							
7. What is the role of DCC in the transformat:	$ion \mathbf{C} \to \mathbf{D}$?						
Protecting group for the amino group. Protecting group for the hydroxy group.							
☐ Activating agent for the amide bond formation.							
8. TsCl is used in the synthesis to enable:							
 □ Nucleophilic substitution of an amino group. □ Electrophilic substitution of an amino group. □ Nucleophilic substitution of a hydroxy group. □ Electrophilic substitution of a hydroxy group. 							

9. <u>Select</u> all possible reagents which could be us	sed as reagent H:
☐ diluted HCl	□ Zn/HCl
\square K ₂ CO ₃	\square H ₂ SO ₄
☐ diluted KMnO ₄	☐ diluted NaOH
\square SOCl ₂	\square PCl ₅
10. <u>Draw</u> the structure of levobupivacaine, including the appropriate stereochemistry.	
Levobupivacaine C ₁₈ H ₂₈ N ₂ O	
Part II.	
The synthesis of levobupivacaine requires the	
common method to confirm the enantiomeric pur	
amides using Mosher's acid (see the structure of the	he (S) isomer below).
_O C	F ₃
НО	
HO (S)	
O	
(S)-Mosher	rs acid
11. <u>Draw</u> the structure of the amide product for	rmed when the α -amino group of L-lysine is
reacted with (S)-Mosher's acid. Clearly show	the stereochemistry of each chiral center.

12	. <u>How many products</u> will be formed from racemic lysine and (S)-Mosher's acid (consider that only the α -amino group of lysine is reacted)?
	Two diastereoisomers.
	Four diastereoisomers.
	A racemic mixture of two enantiomers.
	Four compounds: two enantiomers and two diastereoisomers.
13	. <u>Select</u> the method(s) which can be used to quantitatively determine the enantiomeric purity of lysine after it is reacted with (S) -Mosher's acid:
	NMR spectroscopy.
	Liquid chromatography.
	Mass spectrometry.
	UV-vis spectroscopy.
