THEORETICAL EXAM

Making science together!

2019-07-26

MINISTÈRE DE L'ÉDUCATION NATIONALE ET DE LA JEUNESSE

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR, DE LA RECHERCHE ET DE L'INNOVATION

General instructions

- This theoretical exam booklet contains **61** pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective designed areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need scratch paper, use the backside of the exam sheets. Remember that nothing outside the designed areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30-minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by ½ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

GOOD LUCK!

Table of Contents

This theoretical exam is composed of 9 independent problems, as follows. Their relative weight is indicated in parenthesis.

| Problem T1: Infinite well and butadiene | (6%) | p. 8 |
|--|------|-------|
| Problem T2: Hydrogen production by water-splitting | (7%) | p. 13 |
| Problem T3: About silver chloride | (5%) | p. 19 |
| Problem T4: From black powder to the discovery of iodine | (7%) | p. 24 |
| Problem T5: Complexes for the formation of nanomachines | (8%) | p. 31 |
| Problem T6: Characterization of a block-copolymer | (8%) | p. 40 |
| Problem T7: Ring motion in a [2]catenane | (6%) | p. 48 |
| Problem T8: Identification and synthesis of inositols | (6%) | p. 53 |
| Problem T9: Synthesis of levobupivacaine | (7%) | p. 58 |

Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in mol L^{-1} . To further simplify formulas and expressions, the standard concentration $c^{\circ} = 1 \text{ mol } L^{-1}$ is omitted.

Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written CH_2 =CH-CH= CH_2 , with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the π electrons are better described by a distribution along the three bonds:

This system can be modeled as a 1D box (*i.e.* infinite well) where the electrons are free. The energy of an electron in an infinite well of length L is: $E_n = \frac{n^2 h^2}{8m_e L^2}$, where n is a **non-zero** positive integer.

1. Two different models are studied. <u>Sketch</u> at least the three lowest-energy levels E_n <u>for each model</u> in the respective diagrams, showing how the relative energy levels differ within and between models.

Model 1 (**« localized »**): The π electrons are localized on the extremal bonds and evolve in two separate infinite potential wells of length d.

Model 2 (« delocalized »): The π electrons are delocalized on the whole molecule and evolve in a single infinite potential well of length 3d.

2. Place the π electrons for model 1 in the previous diagrams and express the total energy of the π system in model 1, as a function of h, m_e and d.

| E(1) = | | |
|--------|--|--|

3. Place the π electrons for model 2 in the previous diagrams and express the total energy of the π system in model 2, as a function of h, m_e and d.

$$E(2) =$$

The conjugation energy is the total energy of the actual π system, minus the sum of the energies of ethylene molecules involving the same number of electrons.

4. Express the conjugation energy ΔE_c of butadiene, as a function of h, m_e and d.

$$\Delta E_{\rm c} =$$

Models 1 and 2 are too simplistic. A new model will be detailed in the following.

5. **Draw** three other resonance structures of butadiene using Lewis notation.

To take into account the size of carbon atoms, model 2 is now modified into model 3, as follows:

- the new length of the well is L and is located between the abscissa 0 and L;
- the carbon atoms are located at the abscissas L/8; 3L/8; 5L/8 and 7L/8.

For each level n, the π wavefunction is:

$$\psi_{\rm n}(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$$

and the π electron density for a system with $N \pi$ electrons is:

$$\rho(x) = 2 \sum_{i=1}^{N/2} |\psi_i(x)|^2$$

The four π wavefunctions, which correspond to the molecular orbitals of the π system, are depicted below (**arbitrary order**).

6. **Sort** the energies of the four π wavefunctions (E_A , E_B , E_C and E_D).

< < <

7. <u>Give</u> the labels (A, B, C or D) of the orbitals that are filled with electrons in butadiene.

8. Within model 3, <u>give</u> the values of the π wavefunctions ψ_n for occupied levels at positions 0, L/4 and L/2, for n = 1 and n = 2, as a function of L.

 $\psi_1(0) =$

$$\psi_1\left(\frac{L}{4}\right) =$$

$$\psi_1\left(\frac{L}{2}\right) =$$

$$\psi_2(0) =$$

$$\psi_2\left(\frac{L}{4}\right) =$$

$$\psi_2\left(\frac{L}{2}\right) =$$

9. Within model 3, give the value of the π electron density at positions 0, L/4 and L/2.

$$\rho(0) =$$

$$\rho\left(\frac{L}{4}\right) =$$

$$\rho\left(\frac{L}{2}\right) =$$

10. **Draw** the π electron density between 0 and L.

- 11. **Sort** the following CC bonds (B1, B2, ..., B5) by increasing length, using the symbols = or <:
 - B1: C1C2 in the butadiene molecule
 - B2: C2C3 in the butadiene molecule
 - B3: C3C4 in the butadiene molecule
 - B4: CC in the ethane molecule
 - B5: CC in the ethene molecule

Problem T2: Hydrogen production by water-splitting

Data:

| Compound | $H_2(g)$ | H ₂ O(1) | H ₂ O(g) | O ₂ (g) |
|---|----------|---------------------|---------------------|--------------------|
| $\Delta_{\rm f} H^{\circ} ({\rm kJ~mol^{-1}})$ | 0 | -285.8 | -241.8 | 0 |
| $S_{\mathrm{m}}^{\circ} (\mathrm{J} \; \mathrm{mol}^{-1} \mathrm{K}^{-1})$ | 130.6 | 69.9 | 188.7 | 205.2 |

Molecular hydrogen (H_2) can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

| 1. | <u>Write down</u> the balanced equation of liquid water splitting reaction <u>using a stoichiometric</u> <u>coefficient of 1 for water</u> . |
|----|--|
| | |
| | |
| 2. | Using only the provided thermodynamic data, justify numerically whether this reaction is thermodynamically favorable at 298 K. |
| Са | alculations: |
| | |
| | |
| | |
| Re | eaction thermodynamically favorable? |
| | □ Yes □ No |
| | |

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected by a generator (Fig. 1). Gas bubbles are formed at both electrodes.

Fig. 1 – Water-splitting electrochemical cell.

3. Write down the balanced net electrochemical half reactions occurring at each electrode.

| On electrode (1): | |
|-------------------|--|
| On electrode (2): | |
| | |

4. Using only the provided thermodynamic data (or question 2), <u>derive</u> the condition on the applied voltage ΔE_{th} between electrodes $\Delta E_{\text{applied}}$ compared to a volume ΔE_{th} (to determine)for the process to be thermodynamically favorable at 298 K, when all reactants and products are in their standard state. **Tick** the right condition and **give** the numerical value with 3 decimal places.

| state. Alexa die right condition and give the numerical varies with 5 decimal places. |
|---|
| Calculation: |
| |
| |
| |
| |
| |
| \square $\Delta E_{\mathrm{applied}} = \Delta E_{\mathrm{th}}$ |
| \Box $\Delta E_{\text{applied}} > \Delta E_{\text{th}} \dots \Delta E_{\text{th}} = \text{(give the result with 3 decimal places)}$ |
| \square $\Delta E_{\text{applied}} < \Delta E_{\text{th}}$ |
| If you could not calculate $\Delta E_{	ext{th}}$, the value 1.200 V |
| can be used in the rest of the problem. |

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting, ΔE_{\min} , depends on the nature of the anode, as displayed in the table below:

| Anode | ΔE_{\min} (V) |
|-----------|-----------------------|
| IrO_x | 1.6 |
| NiO_x | 1.7 |
| CoO_x | 1.7 |
| Fe_2O_3 | 1.9 |

The difference between ΔE_{\min} and ΔE_{th} is responsible for losses in the device.

5. <u>Give</u> the expression of the device power efficiency η_{elec} (fraction of the power used for water splitting) as a function of ΔE_{th} and ΔE_{min} . Assuming an identical current value *I*, <u>calculate</u> the water electrolysis power efficiency when a Pt cathode and a Fe₂O₃ anode are used. <u>Give</u> the most efficient anode.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

Fig. 2 – Activation condition and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. SHE = Standard Hydrogen Electrode

Fig. 3 – Left axis: Spectral distribution of the solar photon flux ϕ . The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with smaller wavelength).

6. Estimate the fraction of the solar photon flux that can activate the following semiconductors: TiO₂, CdS, Si. State explicitly the equations and units used for the computation.

Problem T3: About silver chloride

Data at 298 K:

 $pK_{s1}(AgCl) = 9.7; pK_{s2}(Ag_2CrO_4) = 12$

Formation constant of the complex $[Ag(NH_3)_n]^+$: $\beta_n = 10^{7.2}$

Potentials against the standard hydrogen electrode:

Standard potential of $Ag^{+}/Ag(s)$: $E^{\circ}(Ag^{+}/Ag(s)) = 0.80 \text{ V}$

Apparent potential of $O_2(aq)/HO^-(aq)$ (in seawater): $E'(O_2(aq)/HO^-(aq)) = 0.75 \text{ V}$

Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778–1850) deal with some properties of silver chloride.

Quote A: "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."

Quote B: "This salt has no taste since it is insoluble."

Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."

Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."

Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."

Quote F: "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

2. **Quote B: Calculate** the solubility s of AgCl(s) in water at 298 K in mol L^{-1} .

1. **Quote A: Write** the balanced chemical equation of AgCl(s) synthesis.

| Calculation: | | |
|--------------|-----|--------------|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | _ | 1 T -1 |
| | s = | $mol L^{-1}$ |

3. **Quote C:** In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry 1:2 is formed. On the following qualitative axis (with pCl increasing from left to

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry n is formed.

4. Write the balanced equation corresponding to the synthesis of the complex [Ag(NH₃)_n]⁺ from silver chloride and <u>calculate</u> the corresponding equilibrium constant.

Equation: K = $If you could not calculate K, the following value can be used in the rest of the problem: <math>K = 10^{-3}$

5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears. At this moment, $[NH_3] = 1.78 \text{ mol } L^{-1}$. **Determine** the stoichiometry of the complex neglecting dilution effects.

Problem T4: From gunpowder to the discovery of iodine

In the 19th century, the French entrepreneur B. Courtois specialized in the production of nitrate $\bf A$ ($\bf M_A(NO_3)_m$), used for gunpowder. Initially imported from Asia, $\bf A$ was later produced from nitrate $\bf B$ ($\bf M_B(NO_3)_n$) using exchange reaction with compound $\bf C$, obtained from algae.

1. Find the formulas of nitrates A and B knowing that they are anhydrous salts of alkaline or alkaline-

| earth metal (M_A and M_B). One of while the other contains 9 ± 3 is 38.4 w% and 22.4 w% respectively. | w% of impurities. The co | ontent of metals $\mathbf{M}_{\mathbf{A}}$ and \mathbf{M} | |

To obtain A, 262.2 g of solid compound C were added to the solution containing 442.8 g of B. B is known to be in excess. As a result, 190.0 g of white precipitate **D** were formed and removed by filtration. The filtrate was evaporated, and the obtained solid mixture E was heated until the mass of the sample (containing only nitrites, NO₂⁻) was constant. The only gaseous product was dioxygen: 60.48 L at 0 °C at 1 atm (dioxygen can be considered as an ideal gas). <u>Calculate</u> the composition (in w%) of mixture E considering that it contained only compounds A and **B** and no other impurities, and that **C** was taken in pure anhydrous state.

In 1811, when working with algae ashes, Courtois observed that copper vessels were worn out faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled the solution of concentrated sulfuric acid on the dry algae ashes: violet vapors instantly came out of the vessel (1, sulfuric acid is the oxidizing agent): iodine (I₂) had just been discovered! Iodine was the cause

of the copper corrosion (2). However, because of the medicinal applications of iodine, Courtois opened a new manufacture to produce it by reaction of algae with chlorine (3).

Nowadays, iodine is prepared from the set of reactants (NO_3^- , I^- , H^+) (4) or (IO_3^- , I^- , H^+) (5).

4. <u>Write</u> balanced equations for reactions 1–5.

| 1 | | | |
|---|--|--|--|
| 2 | | | |
| 3 | | | |
| 4 | | | |
| 5 | | | |

The solubility of iodine is very low in water but significantly increases when iodide ions are added. Together they form ions such as triiodide, I_3^- :

$$I^{-}(aq) + I_{2}(aq) = I_{3}^{-}(aq)$$
 (6)

Equilibrium (6) can be studied through the extraction of I_2 with dichloromethane. Indeed, I^- and I_3^- do not dissolve in organic solvents but I_2 does and, when extracted, it is 15 times more concentrated in dichloromethane than in water.

The following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of potassium iodide (0.1112 g). Then, 50.0 mL of dichloromethane were added, and the mixture was vigorously shaken until equilibration. After phase separation, each phase was titrated by 16.20 mL (organic phase) and by 8.00 mL (aqueous phase) of the standard aqueous solution of sodium thiosulphate pentahydrate (14.9080 g in 1.000 L of solution) in the presence of starch. The process is schematically represented below:

Problem T5: Azobenzene – β -cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of an energy source into a nanomovement for applications such as drug delivery. Numerous nanomachines make use of the isomerization of azo compounds (R-N=N-R') upon irradiation.

1. **<u>Draw</u>** the stereoisomers of azobenzene ($H_5C_6-N=N-C_6H_5$) and <u>**draw**</u> a line between the two carbon atoms that are the furthest apart. <u>**Compare**</u> these two distances (d_{trans} and d_{cis}).

Fig. 1 – Possible reactants for the synthesis of M.

2. **M** can be synthesized in two steps from simple reactants (Fig. 1). **Choose** among the suggested reactants (**N** to **Q**) the ones that can provide **M** with very high regioselectivity. Sodium nitrite (NaNO₂) in cold aqueous hydrochloric acid is used as reagent for the first step of the synthesis.

Determination of the association constant K_t

β-cyclodextrin (**C**, Fig. 2) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In tasks 3 to 6, we will determine by spectroscopy the association constant K_t , corresponding to the formation of the inclusion complex CM_{trans} as depicted in Fig. 2.

$$K_{t}$$
 K_{t}
 K

Fig. 2 – Formation of the CM_{trans} inclusion complex.

Several solutions are prepared by mixing C and M_{trans} in different proportions to reach initial concentrations $[C]_0$ and $[M_{trans}]_0$. While $[M_{trans}]_0$ is identical for all solutions, $[C]_0$ varies. We follow, at a fixed wavelength, the evolution of the difference in absorbance ΔA between the absorbance of each solution and the pure M_{trans} solution. We note the molar absorption coefficients of CM_{trans} and M_{trans} , respectively. L is the path length of the beam through the sample. The absorbance of C (ε_C) is negligible.

3. **<u>Demonstrate</u>** that $\Delta A = \alpha \cdot [\mathbf{CM_{trans}}]$ and <u>express</u> α in terms of known constant(s).

In tasks 7 to 9, we will determine by kinetic studies the association constant K_c , corresponding to the formation of the inclusion complex with \mathbf{M}_{cis} , \mathbf{CM}_{cis} . A sample containing only \mathbf{M}_{trans} is irradiated, thus producing a known amount of \mathbf{M}_{cis} , $[\mathbf{M}_{cis}]_0$. \mathbf{M}_{cis} (free or within the inclusion complex) then thermally isomerizes into \mathbf{M}_{trans} . In the absence of \mathbf{C} , the isomerization follows a first order kinetics with a rate constant k_1 . All complexation equilibria are faster than the isomerization processes. The kinetic scheme corresponding to this experiment is provided in Fig. 4.

Fig. 4 – Kinetic scheme for the isomerization of M_{cis} in the presence of C.

The rate of disappearance r for the total amount of \mathbf{M}_{cis} (free and complexed) is defined as $r = k_1[\mathbf{M}_{cis}] + k_2[\mathbf{C}\mathbf{M}_{cis}]$

Experimentally, r follows an apparent first order kinetic law with an apparent rate constant k_{obs} : $r = k_{\text{obs}}([\mathbf{M}_{\text{cis}}] + [\mathbf{CM}_{\text{cis}}])$

7. **<u>Demonstrate</u>** that $k_{\text{obs}} = \frac{\gamma + \delta \cdot k_2[C]}{1 + K_C[C]}$ and $\underline{\text{express}} \gamma$ and δ in terms of known constant(s).

Formation of nanomachines

Fig. 5 – Cleavage of an azobenzene-cyclodextrin inclusion complex induced by a light-triggered isomerization, which allows delivery of a dye (grey sphere).

Another azobenzene compound (for which $K_c \ll K_t$), initially in the *trans* form, is covalently grafted on silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, grey circles in Fig. 5). Upon addition of C, an inclusion complex is formed, which blocks the pores and prevents the release of the dye.

10. <u>Choose</u> the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of **C**, and the dye can be released upon irradiation.

```
\begin{array}{cccc} & & K_t >> 1 \\ & & & K_t >> 1 \text{ and } K_c << 1 \\ & & & K_t / K_c << 1 \\ & & & K_t >> 1 \text{ and } K_c >> 1 \\ & & & & K_c << 1 \end{array}
```

This azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that this powder cannot move into solution. The powder is irradiated at a wavelength λ_1 to trigger the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength λ_2 .

Fig. 6 – Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line) and rhodamine B (dashed line).

Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule are studied.

Study of the first block

In this first part, we will study the water soluble homopolymer 1 (α -methoxy- ω -aminopolyethyleneglycol).

The ¹H NMR spectrum of **1** (DMSO-*d*₆, 60 °C, 500 MHz) includes the following signals:

| Index | δ (ppm) | Peak Area |
|-------|---------|-----------|
| a | 2.7* | 0.6 |
| b | 3.3 | 0.9 |
| С | 3.4 | 0.6 |
| d | ~ 3.5 | 133.7 |

Table 1, *in the presence of D_2O , the signal at 2.7 ppm disappears.

1. Match the ¹H NMR signals (a, b, c, d) from Table 1 with each of the corresponding protons.

2. **Express** the average degree of polymerization n as a function of the area A_{OC2H4} of the NMR peak of the repeating unit and the area A_{OCH3} of the NMR peak of the methyl end group. **Calculate** n.

n =

If you could not calculate n, the value n = 100 can be used in the rest of the problem.

Study of a diblock-copolymer

The synthesis of the second block of the copolymer is performed through the reaction of 1 with 2 (ϵ -(benzyloxycarbonyl)-lysine N-carboxyanhydride). This yields the block-copolymer 3.

$$O = \begin{pmatrix} H & & \\ &$$

3. <u>Draw</u> the reaction intermediate that is formed in the first step of the addition of 1 to 2. The second step of the mechanism leads to the formation of a gas molecule, **G. Draw** its structure.

 \mathbf{G} :

4. Infrared (IR) measurements are performed to characterize the compounds. <u>Match</u> the three IR spectra with compounds 1, 2 and 3.

5. The ¹H NMR spectrum of copolymer **3** (in DMSO- d_6 , at 60 °C, 500 MHz) is reported in Fig. 1. Using some or all of the NMR signals, the areas of which are reported in Table 2, <u>calculate</u> its number average molar mass M_n , considering n from question 2. For your calculations, <u>draw</u> a circle around the group(s) of atoms you used and <u>give</u> their corresponding symbol(s) (α , β ...).

Fig. 1 – signals marked with * correspond to the solvent and water.

$$H = \begin{pmatrix} 0 \\ N \\ H \end{pmatrix}_{m} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$
 OCH₃

 $M_{\rm n} = {\rm kg \ mol^{-1}}$ Provide your answer with two decimal places.

This reaction of **1** with **2** yielded the copolymers **3a** after 20 h, **3b** after 25 h and **3c** after 30 h of reaction at 40 °C. Results of size-exclusion chromatography (SEC) experiments are presented in Fig. 2.

Fig. 2 – SEC chromatograms of 3a, 3b and 3c as a function of the elution volume, V_e .

6. Match the signals in Fig. 2 with the copolymers 3a, 3b and 3c.

| 3a: | $\square X$ | $\square Y$ | $\square Z$ | |
|-------------|-------------|-------------|-------------|--|
| 3b : | $\square X$ | $\square Y$ | $\square Z$ | |
| 3c: | $\square X$ | $\square Y$ | $\square Z$ | |

In order to calibrate the chromatogram, a mixture of standard polymers of known masses $(3, 30, 130, 700 \text{ and } 7000 \text{ kg mol}^{-1})$ has been studied (Fig. 3).

The log value of the molar mass is a linear function of the elution volume, Ve.

Fig. 3 – SEC chromatogram of the mixture of standards.

7. Based on the SEC curves in Fig. 2 and 3, <u>determine</u> V_e of the polymer that corresponds to curve X and use it to <u>estimate</u> the degree of polymerization m of its second block. <u>Detail</u> your calculation; you may use a calculator or plot a graph.

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example of these is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper (+I or +II), two configurations are obtained (Fig. 1).

Fig. 1 – Multi-stability of a ring in a [2] catenane.

| 5. | G is obtained by the reaction between F and LiBr in acetone. This reaction is: |
| | electrophilic aromatic substitution |
| | nucleophilic aromatic substitution |
| | $S_{N}1$ |
| Ш | S_N2 |

6. <u>Draw</u> the transition state of the rate-determining step of the reaction $\mathbf{F} \to \mathbf{G}$, showing the 3D geometry. Depict only one reaction center. The main carbon chain can be represented as an R group.

| Transition state: | | |
|-------------------|--|--|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

The synthesis of [2] catenane L uses the template effect of a copper complex:

7. <u>Write</u> the full electronic configuration of Cu(0) in its ground state. Give the oxidation state of Cu in complex **J** and write the electronic configuration of Cu in the free ion corresponding to **J**.

| Electronic configuration of Cu(0): | |
|--|--|
| | |
| | |
| Oxidation state of Cu in J : | |
| Electronic configuration of Cu in J : | |
| | |
| | |

8. **Select** the geometry of the copper ion in **L**. Assuming an ideal geometry of the ligands around the copper center, **draw** the electronic levels of the d orbitals subject to the crystal field. **Fill** the orbital diagram. **Give** the maximum value of the spin (S) for this complex.

The geometry of Cu in L is:

☐ Octahedral
☐ Tetrahedral
☐ Square planar
☐ Trigonal bipyramid

Splitting and filling of d orbitals:

9. Out of the following compounds, $\underline{\mathbf{choose}}$ the one(s) that can remove the copper ion in \mathbf{L} to obtain the free [2]catenane:

$$\begin{array}{c|c} \square & CH_3CN \\ \square & NH_4PF_6 \\ \square & KCN \\ \square & tren \end{array}$$

In [2]catenane **L**, the copper ion can exist in two oxidation states (+I) or (+II), and each of them exhibits a different coordination sphere (tetra- or penta-coordinated, respectively).

Fig. 2 – [2] catenane L states

The stability of Cu(I) complexes can be inferred by comparing their electronic structures to that of a noble gas.

10. **Fill** in the blanks with a number or a tick:

| The Cu ^I N ₄ complex has electr | ons in the coordination | sphere of the metal. | | | | | | | | | | |
|--|-------------------------|----------------------|--|--|--|--|--|--|--|--|--|--|
| The Cu ^I N ₅ complex has electrons in the coordination sphere of the metal. | | | | | | | | | | | | |
| The Cu^IN_4 complex is \square more / \square less stable than the Cu^IN_5 complex. | | | | | | | | | | | | |
| 11. <u>Fill</u> in the solid boxes with the designation of the involved complexes in Fig. 2 and <u>complete</u> the sequence to achieve electrochemical control of the system using the following notation for the dashed boxes: (rotation); + e ⁻ ; - e ⁻ . | | | | | | | | | | | | |
| (rotation), re | , | | | | | | | | | | | |
| Cu ^l N₄ | | | | | | | | | | | | |
| ^ | | | | | | | | | | | | |
| | - | | | | | | | | | | | |

Problem T8: Identification and synthesis of inositols

In this problem, we define " $\underline{^{3D}}$ structure" and " $\underline{^{perspective}}$ formula" as indicated for β -glucose in the following figure.

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles, in particular *myo*-inositol, are involved in a number of biological processes.

Draw the structural formula of inositols, without stereochemical details

Structure of myo-inositol

| This family of molecules contains 9 different stereoisomers, including enantiomers. |
|---|
| This thing of motories contains y director states and the first manners. |
| |
| 2 Draw all 3D structures of the stereoisomers that are ontically active |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |

| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |
| 2. <u>Draw</u> all 3D structures of the stereoisomers that are optically active. |

The structure of a specific inositol, called *myo*-inositol, is studied here. Only one of its chair conformers is predominant and its structure can be deduced from its ¹H NMR spectrum. The spectrum below was obtained at 600 MHz in D₂O. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. <u>Give</u> the molecular formula of the predominant compound derived from *myo*-inositol in this sample that is consistent with the number of protons observed in the ¹H NMR spectrum.

| 4. | Based on the number and integrations of the proton signals, give the number of symmetry plane(s) |
|----|--|
| | that exist(s) in this molecule. |

5. <u>Complete</u> the following perspective drawing of the most stable conformation of *myo*-inositol. Then <u>label</u> each hydrogen with the corresponding letter (**a**, **b**, **c** or **d**) according to the NMR spectrum above. Proton **a** must be on carbon **a** on the following representation. <u>Draw</u> its 3D structure.

Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. <u>Choose</u> the correct structural relationship(s) between 2 and 3.

| enantiomers |
|---------------|
| epimers |
| diastereomers |
| atropoisomers |

Inositol 2 can be obtained from compound 1 in 7 steps.

Problem T9: Synthesis of levobupivacaine

Part I.

The local anesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization List of Essential Medicines. Although the drug is currently used as a racemic mixture, it was demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and, therefore, safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

$$CI^{-}$$
 $H_3\dot{N}$
 O^{-}

L-Lysine hydrochloride

1. <u>Assign</u> the absolute configuration of the stereogenic center in L-lysine hydrochloride and <u>justify</u> your answer by classifying the substituents in order of their priority.

| Configuration: | Priority $1 > 2 > 3 > 4$: | | | |
|----------------|--|---------|----------|---------|
| $\square R$ | NH ₃ ⁺ Cl ⁻ | 44 NH3+ | 1000 COO | KANAN H |
| | | | | |

2. The prefix L in L-lysine refers to relative configuration. **Choose** all correct statements:

| | All natural L-amino acids are levorotatory. |
|--|--|
| | Natural L-amino acids can be levorotatory or dextrorotatory. |
| | All natural L-amino acids are (S). |
| | All natural L-amino acids are (R) . |

Often, we want only one of the amino groups in L-lysine to react. A Cu^{2+} salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed NH_2 group is available to react.

3. Considering that L-lysine acts as a bidentate ligand and that two L-lysine coordinate to one Cu²⁺ ion in the presence of aqueous hydroxide, **draw** the structure of the intermediate complex.

| (| Complex | | | | |
|---|---------|--|--|--|--|
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without Cu^{2+} salt.

$$\begin{array}{c} \text{CI} \\ \\ \text{H}_{3} \\ \text{N} \\ \text{L-Lysine} \\ \text{hydrochloride} \\ \end{array} \begin{array}{c} \text{1) 1 eq. LiOH} \\ \text{2) 1 eq. PhCHO} \\ \end{array} \begin{array}{c} \text{A} \\ \end{array} \begin{array}{c} \text{1) NaOH, Cbz-Cl} \\ \text{2) diluted HCl} \\ \text{3) aqueous buffer} \\ \text{pH 6.2} \\ \end{array} \begin{array}{c} \text{R} \\ \text{C}_{14} \\ \text{H}_{20} \\ \text{N}_{2} \\ \text{O}_{4} \\ \end{array} \\ \end{array} \begin{array}{c} \text{NaNO}_{2}, \text{NaOAc} \\ \text{AcOH} \\ \text{C}_{16} \\ \text{H}_{21} \\ \text{NO}_{6} \\ \end{array} \begin{array}{c} \text{C} \\ \text{NH}_{2} \\ \text{DCC} \\ \end{array} \begin{array}{c} \text{D} \\ \text{1) K}_{2} \\ \text{CO}_{3}, \text{H}_{2} \\ \text{2) TsCl, NEt}_{3} \\ \end{array} \begin{array}{c} \text{E} \\ \text{C}_{29} \\ \text{H}_{34} \\ \text{N}_{2} \\ \text{O}_{6} \\ \end{array} \\ \begin{array}{c} \text{AcO = CH}_{3} \\ \text{COO} \\ \end{array} \begin{array}{c} \text{COO}_{3} \\ \text{AcO = CH}_{3} \\ \text{COO} \\ \end{array} \begin{array}{c} \text{COO}_{4} \\ \text{COO}_{4} \\ \text{COO}_{4} \\ \text{COO}_{4} \\ \text{COO}_{4} \\ \text{COO}_{5} \\ \end{array} \begin{array}{c} \text{NEt}_{3} \\ \text{COO}_{4} \\ \text{COO}_{5} \\ \text{COO}_{6} \\ \text{COO}_{6} \\ \text{COO}_{7} \\ \text{COO}_{7} \\ \text{COO}_{8} \\ \text{COO}_{7} \\ \text{COO}_{8} \\ \text{COO}_{9} \\$$

From this point on, you can use the abbreviations proposed in the scheme above.

4. **Draw** the structure of compound **A**, including the appropriate stereochemistry.

| A | | | |
|---|--|--|--|
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

5. Transformation of L-lysine into **A** is (**choose** proper answer(s)):

- □ an enantioselective reaction.
 □ an enantiospecific reaction.
 □ a regioselective reaction.
- 6. <u>Draw</u> the structures of compounds **B**–**F**, including the appropriate stereochemistry.

| $\mathbf{B} \mathrm{C}_{14} \mathrm{H}_{20} \mathrm{N}_2 \mathrm{O}_4$ | C C ₁₆ H ₂₁ NO ₆ | |
|--|---|--|
| | | |
| | | |
| | | |
| | | |
| D. | ECH NOC | |
| D | $\mathbf{E} \ C_{29} H_{34} N_2 O_6 S$ | |
| | | |
| | | |
| | | |
| | | |
| $\mathbf{F} \mathbf{C}_{21} \mathbf{H}_{28} \mathbf{N}_2 \mathbf{O}_4 \mathbf{S}$ | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| 7. What is the role of DCC in the transformation $\mathbf{C} \to \mathbf{D}$? | | |
| □ Protecting group for the amino group. □ Protecting group for the hydroxy group. □ Activating agent for the amide bond formation. | | |
| 8. TsCl is used in the synthesis to enable: | | |
| □ Nucleophilic substitution of an amino group. □ Electrophilic substitution of an amino group. □ Nucleophilic substitution of a hydroxy group. □ Electrophilic substitution of a hydroxy group. | | |

9. Mark all possible reagents which could be used as reagent H:

| | uted HCl | □ Zn/HCl |
|---|---|--|
| □ K₂O □ dilu | CO3 uted KMnO4 | ☐ H ₂ SO ₄ ☐ diluted NaOH |
| □ SO | | □ PCl ₅ |
| 10. <u>Draw</u> the structure of levobupivacaine, including the appropriate stereochemistry. | | |
| Levob | oupivacaine C ₁₈ H ₂₈ N ₂ O | |
| | | |
| | | |
| | | |
| | | |
| | | |
| D1 | | |
| Part II. The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of aminoacids is their transformation into amides using Mosher's acid (see the structure of the (<i>S</i>) isomer below). | | |
| | O CF | 3 |
| | HO CF | |
| | • | / / |
| | (S)-Mosher's | acid |
| 11. <u>Draw</u> the structure of the amide formed when the α-amino group of L-lysine is derivatized with (<i>S</i>)-Mosher's acid. Clearly show the stereochemistry of each chiral center. | | |
| | | |
| | | |
