## General instructions

- This theoretical exam booklet contains 64 pages.
- You may begin writing as soon as the Start command is given.
- You have 5 hours to complete the exam.
- All results and answers must be clearly written in pen in their respective designated areas on the exam papers. Answers written outside the answer boxes will not be graded.
- If you need rough working space, use the backside of the exam sheets. Remember that nothing outside the designated areas will be graded.
- Use only the pen and calculator provided.
- The official English version of the exam booklet is available upon request and serves for clarification only.
- If you need to leave the exam room (to use the toilet or have a snack), wave the corresponding IChO card. An exam supervisor will come to accompany you.
- For multiple-choice questions: if you want to change your answer, fill the answer box completely and then make a new empty answer box next to it.
- The supervisor will announce a 30 -minute warning before the Stop command.
- You must stop your work immediately when the Stop command is announced. Failure to stop writing by $1 / 2$ minute or longer will lead to nullification of your theoretical exam.
- After the Stop command has been given, place your exam booklet back in your exam envelope, then wait at your seat. The exam supervisor will come to seal the envelope in front of you and collect it.

## Table of Contents

#### Abstract

This theoretical exam is composed of 9 independent problems, as follows. Their relative weighting is indicated in brackets.

Problem T1: Infinite well and butadiene
Problem T2: Hydrogen production by water-splitting
Problem T3: About silver chloride
Problem T4: From gunpowder to the discovery of iodine
Problem T5: Complexes for the formation of nanomachines
Problem T6: Characterization of a block-copolymer
Problem T7: Ring motion in a [2]catenane
Problem T8: Identification and synthesis of inositols
Problem T9: Synthesis of levobupivacaine
p. 8
(7\%)
(5\%)
(7\%)
p. 24
(8\%)
p. 31
(8\%)
p. 40
(6\%)
p. 48
(6\%)
p. 54

## Physical constants and equations

In these tasks, we assume the activities of all aqueous species to be well approximated by their respective concentration in $\mathrm{mol} \mathrm{L}^{-1}$. To further simplify formulas and expressions, the standard concentration $c^{\circ}=1 \mathrm{~mol} \mathrm{~L}^{-1}$ is omitted.

Avogadro's constant:
Universal gas constant:
Standard pressure:
Atmospheric pressure:
Zero of the Celsius scale:
Faraday constant:
Watt:
Kilowatt hour:
Planck's constant:
Speed of light in a vacuum:
Elementary charge:
Electron-volt
Electrical power:
Power efficiency:
Planck-Einstein relation:
Ideal gas equation:
Gibbs free energy:

## Problem T1: Infinite well and butadiene

The buta-1,3-diene molecule is often written $\mathrm{CH}_{2}=\mathrm{CH}-\mathrm{CH}=\mathrm{CH}_{2}$, with alternating single and double bonds. Nevertheless, its chemical reactivity is not consistent with this description and the $\pi$ electrons are better described by a distribution along the three bonds:

$$
\mathrm{C}=\mathrm{C}=-\mathrm{C}=-\mathrm{C}
$$

This system can be modelled as a 1D box (i.e. infinite potential well) where the electrons are free. The energy of an electron in a 1 D box of length $L$ is: $E_{n}=\frac{n^{2} h^{2}}{8 m_{e} L^{2}}$, where $n$ is a non-zero positive integer.

1. Two different models are studied. $\underline{\text { Sketch}}$ at least the three lowest-energy levels $E_{\mathrm{n}}$ for each model in the respective diagrams, showing how the relative energy levels differ within and between models.

Model 1 («localized»): The $\pi$ electrons are localized on the extremal bonds and evolve in two separate infinite potential wells of length $d$.

Model 2 («delocalized»): The $\pi$ electrons are delocalized on the whole molecule and evolve in a single infinite potential well of length 3 d .
2. Place the $\pi$ electrons for model 1 in the previous diagram and express the total energy of the $\pi$ system in model 1 as a function of $h, m_{\mathrm{e}}$ and $d$.
$\square$
3. Place the $\pi$ electrons for model 2 in the previous diagram and express the total energy of the $\pi$ system in model 2 as a function of $h, m_{\mathrm{e}}$ and $d$.
$E(2)=$

The conjugation energy is the total energy of the actual $\pi$ system, minus the sum of the energies of ethylene molecules involving the same number of electrons.
4. Express the conjugation energy $\Delta E_{\mathrm{c}}$ of butadiene, as a function of $h, m_{\mathrm{e}}$ and $d$.
$\Delta E_{\mathrm{c}}=$

Models 1 and 2 are too simplistic. A new model will be detailed in the following parts.
5. Draw three other resonance structures of butadiene using Lewis notation.

|  |  |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{H}_{2} \mathrm{C}^{\wedge}=\mathrm{CH}_{2}$ |  |  |  |
|  |  |  |  |

To take into account the size of carbon atoms, model 2 is now modified into model 3, as follows:

- the new length of the well is $L$ and is located between the x-coordinates 0 and $L$;
- the carbon atoms are located at the x-coordinates $L / 8 ; 3 L / 8 ; 5 L / 8$ and $7 L / 8$.

For each level $n$, the $\pi$ wavefunction is:

$$
\psi_{\mathrm{n}}(x)=\sqrt{\frac{2}{L}} \sin \left(\frac{n \pi x}{L}\right)
$$

and the $\pi$ electron density for a system with $N \pi$ electrons is:

$$
\rho(x)=2 \sum_{i=1}^{N / 2}\left|\psi_{i}(x)\right|^{2}
$$

The four $\pi$ wavefunctions, which correspond to the molecular orbitals of the $\pi$ system, are depicted below (in arbitrary order).

6. Sort the energies of the four $\pi$ wavefunctions $\left(E_{\mathrm{A}}, E_{\mathrm{B}}, E_{\mathrm{C}}\right.$ and $\left.E_{\mathrm{D}}\right)$.
$\square$
7. Give the labels $(A, B, C, D)$ of the orbitals that are filled with electrons in butadiene.
8. Within model 3 , give the values of the $\pi$ wavefunctions $\psi_{\mathrm{n}}$ for occupied levels at positions $0, L / 4$ and $L / 2$, for $n=1$ and $n=2$, as a function of $L$.
$\psi_{1}(0)=$
$\psi_{1}\left(\frac{L}{4}\right)=$
$\psi_{1}\left(\frac{L}{2}\right)=$
$\psi_{2}(0)=$
$\psi_{2}\left(\frac{L}{4}\right)=$
$\psi_{2}\left(\frac{L}{2}\right)=$
9. Within model 3, give the value of the $\pi$ electron density at positions $0, L / 4$ and $L / 2$.
$\square$
10. Graph the $\pi$ electron density between 0 and $L$.

11. Sort the following CC bonds (B1, B2, $\ldots, \mathrm{B} 5$ ) by increasing length, using the symbols $=$ or $<$ :
$\mathrm{B} 1: \quad \mathrm{C} 1 \mathrm{C} 2$ in a butadiene molecule
B 2 : $\quad \mathrm{C} 2 \mathrm{C} 3$ in a butadiene molecule
B3: $\quad$ C3C4 in a butadiene molecule
B4: $\quad \mathrm{CC}$ in an ethane molecule
B5 : $\quad \mathrm{CC}$ in an ethene molecule

## Problem T2: Hydrogen production by water-splitting

## Data:

| Compound | $\mathrm{H}_{2}(\mathrm{~g})$ | $\mathrm{H}_{2} \mathrm{O}(1)$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | $\mathrm{O}_{2}(\mathrm{~g})$ |
| :--- | :---: | :---: | :---: | :---: |
| $\Delta_{\mathrm{f}} H^{\circ}\left(\mathrm{kJ} \mathrm{mol}^{-1}\right)$ | 0 | -285.8 | -241.8 | 0 |
| $S_{\mathrm{m}}{ }^{\circ}\left(\mathrm{J} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)$ | 130.6 | 69.9 | 188.7 | 205.2 |

Molecular hydrogen $\left(\mathrm{H}_{2}\right)$ can be used as an alternative to carbon dioxide-emitting fuels. Hence, lowering the cost and the environmental impact of its production is a major challenge. In this field, water-splitting is a promising candidate technology.

1. Write down the balanced equation of the liquid water splitting reaction using a stoichiometric coefficient of 1 for water.
2. Using only the provided thermodynamic data, justify numerically whether this reaction is thermodynamically favourable at 298 K .

Calculations:

Reaction thermodynamically favourable?

Water splitting can be performed electrochemically using two electrodes in an acidic water bath, connected by a generator (Fig. 1). Gas bubbles are formed at both electrodes.

Fig. 1-Water-splitting electrochemical cell.
3. Write down the balanced net electrochemical half reactions occurring at each electrode.

On electrode (1):
On electrode (2):
4. Using only the provided thermodynamic data (or question 2), determine the voltage $E_{\text {th }}$ for the process to be thermodynamically favourable at 298 K , when all reactants and products are in their standard states. Tick the condition on the voltage applied between the electrodes, $E_{\text {applied }}$, for the process to be thermodynamically favourable. Give the numerical value of $E_{\text {th }}$ to 3 decimal places.

Calculation:
$\square \quad E_{\text {applied }}=E_{\text {th }}$

- $E_{\text {applied }}>E_{\text {th }}$
where $E_{\mathrm{th}}=\ldots \ldots \ldots \ldots \mathrm{V}(3$ decimal places $)$
- $E_{\text {applied }}<E_{\text {th }}$

If you cannot calculate $E_{\mathrm{th}}$, the value 1.200 V can be used in the rest of the problem.

Experimentally, a higher voltage is needed to observe water splitting. For a given Pt cathode, the minimum voltage necessary to observe water splitting, $E_{\min }$, depends on the nature of the anode, as displayed in the table below:

| Anode | $E_{\min }(\mathrm{V})$ |
| :---: | :---: |
| $\mathrm{IrO}_{x}$ | 1.6 |
| $\mathrm{NiO}_{x}$ | 1.7 |
| $\mathrm{CoO}_{x}$ | 1.7 |
| $\mathrm{Fe}_{2} \mathrm{O}_{3}$ | 1.9 |

The difference between $E_{\min }$ and $E_{\mathrm{th}}$ is responsible for losses in the device.
5. Give the expression of the device power efficiency $\eta_{\text {elec }}$ (fraction of the power used for water splitting) as a function of $E_{\mathrm{th}}$ and $E_{\text {min }}$. Assuming an identical current value $I$, calculate the water electrolysis power efficiency when a Pt cathode and a $\mathrm{Fe}_{2} \mathrm{O}_{3}$ anode are used. Give the most efficient anode.
$\eta_{\text {elec }}=$

Power efficiency when a Pt and a $\mathrm{Fe}_{2} \mathrm{O}_{3}$ electrodes are used:
$\eta_{\text {elec }}=\quad \%$
Most efficient anode:
If you cannot calculate $\eta_{\text {elec }}$, the value $\eta_{\text {elec }}=75 \%$ can be used in the rest of the problem.

An alternative to water electrolysis is direct photocatalytic water-splitting. It uses a semiconductor that can be activated by absorbing light.

Fig. 2 - Activation conditions and equivalent electrode potentials of different semiconductors. Dashed lines correspond to water oxidation and reduction potentials. $S H E=$ Standard Hydrogen Electrode

Fig. 3 -Left axis: Spectral distribution of the solar photon flux $\phi$. The photon flux is the number of photons per unit area per unit time arriving on the semiconductor. Right axis and dashed line: cumulative photon flux (i.e. fraction of the photon flux with equal or shorter wavelength).
6. Estimate the fraction of the solar photon flux that can activate the following semiconductors: $\mathrm{TiO}_{2}, \mathrm{CdS}, \mathrm{Si}$. State explicitly the equations and units used for the computation.

Explanation/calculation:

|  | Approximate <br> fraction |
| :---: | :---: |
| $\mathrm{TiO}_{2}$ | $\%$ |
| CdS | $\%$ |
| Si | $\%$ |

The activation of the semi-conductor results in a modification of the surface potentials, so that it can be considered to be two electrodes of different potentials.
7. Using the data in Fig. 2, choose the semiconductor(s) in the following list that, once activated, can play the roles of both anode and cathode for the water-splitting reaction.

| $\square \mathrm{ZrO}_{2}$ | $\square \mathrm{ZnO}$ | $\square \mathrm{TiO}_{2}$ | $\square \mathrm{WO}_{3}$ |
| :--- | :--- | :--- | :--- |
| $\square \mathrm{CdS}$ | $\square \mathrm{Fe}_{2} \mathrm{O}_{3}$ | $\square \mathrm{CdSe}^{2}$ | $\square \mathrm{Si}$ |

8. Give the semiconductor that, when used as both anode and cathode, is expected to be the most efficient for water splitting upon a given solar shining.

The evolution of $\mathrm{H}_{2}$ and $\mathrm{O}_{2}$ when a semiconductor is irradiated by simulated solar light at $T=25^{\circ} \mathrm{C}$ at $p_{\mathrm{atm}}$ was recently studied. Using an incident light of power $P=1.0 \mathrm{~kW} \mathrm{~m}^{-2}$ and a photoelectrode with a $S=16 \mathrm{~mm}^{2}$ surface, the production of $V=0.37 \mathrm{~cm}^{3}$ of $\mathrm{H}_{2}(\mathrm{~g})$ was measured after $\Delta t=1$ hour of reaction.
9. Calculate the power efficiency $\eta_{\text {direct }}$ of the conversion.
$\left.\begin{array}{|l|l|}\hline \text { Calculation: } \\ \\ \begin{array}{c}\eta_{\text {direct }}= \\ \text { \% }\end{array} \\ \text { Ifyou cannot calculate } \eta_{\text {direct }} \text { the value } \eta_{\text {direct }}=10 \% \\ \text { can be used in the rest of the problem. }\end{array}\right]$

Two modes of converting solar energy to hydrogen can thus be compared: direct photocatalysis, and indirect photo-electrolysis combining a photovoltaic panel with an electrolytic cell. The efficiency of photovoltaic panels on the market is around $\eta_{\text {panels }}=20 \%$.
10. Compare the power efficiencies of the two modes, $\eta_{\text {direct }}$ and $\eta_{\text {indirect, }}$ using $\mathrm{Fe}_{2} \mathrm{O}_{3}$ and Pt electrodes for the electrolysis.

## Problem T3: About silver chloride

## Data at 298 K:

$\mathrm{p} K_{\mathrm{s} 1}(\mathrm{AgCl})=9.7 ; \mathrm{p} K_{\mathrm{s} 2}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=12$
Formation constant of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}: \beta_{\mathrm{n}}=10^{7.2}$
Potentials against the standard hydrogen electrode:
Standard potential of $\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s}): E^{\circ}\left(\mathrm{Ag}^{+} / \mathrm{Ag}(\mathrm{s})\right)=0.80 \mathrm{~V}$
Apparent potential of $\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{HO}^{-}(\mathrm{aq})$ (in seawater): $E^{\prime}\left(\mathrm{O}_{2}(\mathrm{aq}) / \mathrm{HO}^{-}(\mathrm{aq})\right)=0.75 \mathrm{~V}$

## Part A: Quotes from a chemistry lesson by Louis Joseph Gay-Lussac

The following quotes from a chemistry lesson by Louis Joseph Gay-Lussac (French chemist and physicist, 1778-1850) deal with some properties of silver chloride:

Quote A: "I will now talk about silver chloride, a milk-white solid. It is easily obtained by pouring hydrochloric acid into an aqueous solution of silver nitrate."
Quote B: "This salt has no taste since it is insoluble."
Quote C: "This compound is completely insoluble in alcohol and even in acids, except in concentrated hydrochloric acid which dissolves it readily."
Quote D: "On the other hand, silver chloride is highly soluble in aqueous solution of ammonia."
Quote E: "Then, we can make silver chloride appear again by adding an acid which reacts with ammonia."
Quote F: "If you take a bowl made of silver to evaporate salty seawater, you will get impure sodium chloride, mixed with a milk-white solid."

1. Quote A: Write the balanced chemical equation of $\mathrm{AgCl}(\mathrm{s})$ synthesis.
$\square$
2. Quote B: Calculate the solubility, $s$, of $\mathrm{AgCl}(\mathrm{s})$ in water at 298 K in $\mathrm{mol} \mathrm{L}^{-1}$.

Calculation:

$$
S=
$$

$\mathrm{mol} \mathrm{L}^{-1}$
3. Quote C: In a highly concentrated solution of chloride ions, a well-defined complex of stoichiometry $1: 2$ is formed. On the following qualitative axis (with pCl increasing from left to right), place in each domain the silver-containing species that is predominant (or exists, for solids). pCl values at the boundaries are not expected.

Quote D: When ammonia is added to silver chloride, a well-defined complex of stoichiometry $n$ is formed.
4. Write the balanced equation corresponding to the synthesis of the complex $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{\mathrm{n}}\right]^{+}$from silver chloride and calculate the corresponding equilibrium constant.

## Equation:

Calculation:

$$
K=
$$

If you cannot calculate $K$, the following value can be used in the rest of the problem: $K=10^{-3}$
5. Ammonia is added to 0.1 mol of silver chloride in 1 L of water until the last grain of solid disappears. At this moment, $\left[\mathrm{NH}_{3}\right]=1.78 \mathrm{~mol} \mathrm{~L}^{-1}$. Determine the stoichiometry of the complex, ignoring dilution effects.

Calculation:
$n=$
6. Write the balanced chemical equation corresponding to quote $\mathbf{E}$.
7. Assuming that seawater is slightly basic and rich in dioxygen, and that silver metal can reduce dioxygen in such conditions, write a balanced chemical equation corresponding to the formation of the solid mentioned in quote F. Use a stoichiometric coefficient of 1 for dioxygen. Calculate its equilibrium constant at 298 K .

Equation:

## Calculation:

$$
K=
$$

## Part B: The Mohr method

The Mohr method is based on the colourimetric titration of $\mathrm{Cl}^{-}$by $\mathrm{Ag}^{+}$in the presence of potassium chromate ( $2 \mathrm{~K}^{+}, \mathrm{CrO}_{4}{ }^{2-}$ ). Three drops ( $\sim 0.5 \mathrm{~mL}$ ) of a $\mathrm{K}_{2} \mathrm{CrO}_{4}$ solution at approx. $7.76 \cdot 10^{-3} \mathrm{~mol} \mathrm{~L}^{-1}$ are added to $\mathrm{V}_{0}=20.00 \mathrm{~mL}$ of a sodium chloride solution of unknown concentration $C_{\mathrm{Cl}}$. This solution is then titrated by silver nitrate $\left(\mathrm{Ag}^{+}, \mathrm{NO}_{3}^{-}\right)$at $C_{\mathrm{Ag}}=0.050 \mathrm{~mol} \mathrm{~L}^{-1}$, which immediately leads to the formation of solid $\mathbf{A}$. A red precipitate ( solid $\mathbf{B}$ ) appears at $V_{\mathrm{Ag}}=4.30 \mathrm{~mL}$.
8. Write the balanced equations of the two reactions occurring during the experiment. Calculate the corresponding equilibrium constants.
$\square$
9. Identify the solids.

Solid A:

Solid B:
10. Calculate the unknown concentration $C_{\mathrm{Cl}}$ of chloride ions in the sodium chloride solution.

## Calculation:

11. Calculate the minimum volume $V_{\mathrm{Ag}}(\mathrm{min})$ at which $\mathrm{AgCl}(\mathrm{s})$ precipitates.

Calculation:
$V_{\mathrm{Ag}}(\min )=$ mL
12. Calculate the residual concentration $\left[\mathrm{Cl}^{-}\right]_{\text {res }}$ of chloride ions when silver chromate begins to precipitate. Justify why $\mathrm{CrO}_{4}{ }^{2-}$ is a good titration endpoint indicator by comparing two values.

Calculation:

$$
\left[\mathrm{Cl}^{-}\right]_{\mathrm{res}}=\quad \mathrm{mol} \mathrm{~L}^{-1}
$$

$\mathrm{CrO}_{4}{ }^{2-}$ is a good titration endpoint indicator because:

## Problem T4: From gunpowder to the discovery of iodine

In the $19^{\text {th }}$ century, the French entrepreneur B . Courtois specialized in the production of nitrate $\mathbf{A}$ $\left(\mathbf{M}_{\mathbf{A}}\left(\mathrm{NO}_{3}\right)_{m}\right)$, used for gunpowder. Initially imported from Asia, $\mathbf{A}$ was later produced from nitrate $\mathbf{B}$ $\left(\mathbf{M}_{\mathbf{B}}\left(\mathrm{NO}_{3}\right)_{n}\right)$ using exchange reaction with compound $\mathbf{C}$, obtained from algae.

1. Find the formulas of nitrates $\mathbf{A}$ and $\mathbf{B}$ given that they are anhydrous salts of alkaline or alkalineearth metals $\left(\mathbf{M}_{\mathbf{A}}\right.$ and $\left.\mathbf{M}_{\mathbf{B}}\right)$. One of the nitrates contains no more than $1 \% \mathrm{w} / \mathrm{w}$ (i.e. $\%$ by mass) of non-metallic impurities while the other contains $9 \pm 3 \% \mathrm{w} / \mathrm{w}$ of impurities. The content of metals $\mathbf{M}_{\mathbf{A}}$ and $\mathbf{M}_{\mathbf{B}}$ in the samples is $38.4 \% \mathrm{w} / \mathrm{w}$ and $22.4 \% \mathrm{w} / \mathrm{w}$ respectively. Support your answer with calculations.

To obtain A, 262.2 g of solid compound $\mathbf{C}$ were added to a solution containing 442.8 g of $\mathbf{B} . \mathbf{B}$ is known to be in excess. As a result, 190.0 g of white precipitate $\mathbf{D}$ were formed and removed by filtration. The filtrate was evaporated, and the obtained solid mixture $\mathbf{E}$ was heated until the mass of the sample (containing only nitrites, $\mathrm{NO}_{2}^{-}$) was constant. The only gaseous product was dioxygen: 60.48 L at $0^{\circ} \mathrm{C}$ at 1 atm (dioxygen can be considered as an ideal gas).
2. Calculate the composition (in $\% \mathrm{w} / \mathrm{w}$ ) of mixture $\mathbf{E}$ considering that it contained only compounds $\mathbf{A}$ and $\mathbf{B}$ and no other impurities, and that $\mathbf{C}$ was in its pure anhydrous state.
\%w/w of $\mathbf{A}$ :
and of
B:
3. Determine the formulas of compounds $\mathbf{C}$ and $\mathbf{D}$ and write the balanced reaction equation between $\mathbf{B}$ and $\mathbf{C}$.

Space continues next page

C: and $\mathbf{D}$ :

## Reaction between $\mathbf{B}$ and $\mathbf{C}$ :

In 1811, when working with algae ashes, Courtois observed that copper vessels were worn out faster than usual. While he was studying this phenomenon, his cat entered the laboratory and spilled a solution of concentrated sulfuric acid onto the dry algae ashes: violet vapours instantly came out of the vessel ( 1 , sulfuric acid is the oxidizing agent): iodine $\left(I_{2}\right)$ had just been discovered! Iodine was the cause of the copper corrosion (2). However, because of the medicinal applications of iodine, Courtois opened a new factory to produce it by the reaction of algae with chlorine (3).
Nowadays, iodine is prepared from the set of reactants $\left(\mathrm{NO}_{3}{ }^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}\right)(4)$ or $\left(\mathrm{IO}_{3}^{-}, \mathrm{I}^{-}, \mathrm{H}^{+}\right)(5)$.
4. Write balanced equations for reactions $\mathbf{1 - 5}$.

| 1 |
| :--- | :--- |
| 2 |
| 3 |
| 4 |
| 5 |

The solubility of iodine is very low in water but significantly increases when iodide ions are added. Together they form ions such as triiodide, $\mathrm{I}_{3}{ }^{-}$:

$$
\begin{equation*}
\mathrm{I}^{-}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{aq}) \rightleftharpoons \mathrm{I}_{3}^{-}(\mathrm{aq}) \tag{6}
\end{equation*}
$$

Equilibrium (6) can be studied through the extraction of $\mathrm{I}_{2}$ with dichloromethane. Indeed, $\mathrm{I}^{-}$and $\mathrm{I}_{3}{ }^{-}$do not dissolve in organic solvents but $\mathrm{I}_{2}$ does, and when extracted it is 15 times more concentrated in dichloromethane than in water.

The following experiment was performed. To prepare the initial solution, a few crystals of solid iodine were dissolved in 50.0 mL of an aqueous solution of 0.1112 g of potassium iodide. Then, 50.0 mL of dichloromethane were added, and the mixture was vigorously shaken until equilibrium was reached. After phase separation, the aqueous phase was titrated by 8.00 mL of a standard aqueous solution of sodium thiosulphate pentahydrate $(14.9080 \mathrm{~g}$ in 1.000 L of solution) in the presence of starch. The organic phase was titrated by 16.20 mL of the same thiosulphate solution.

The process is represented schematically below:

## Problem T5: Azobenzene - $\beta$-cyclodextrin complexes for the formation of nanomachines

Nanomachines are molecular assemblies that enable the transformation of an energy source into a nano-movement for applications such as drug delivery. Numerous nanomachines make use of the isomerization of azo compounds ( $\mathrm{R}-\mathrm{N}=\mathrm{N}-\mathrm{R}$ ') upon irradiation.

1. Draw the stereoisomers of azobenzene $\left(\mathrm{H}_{5} \mathrm{C}_{6}-\mathrm{N}=\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{5}\right)$ and draw a line between the two carbon atoms that are the furthest apart. Compare these two distances ( $d_{\text {trans }}$ and $d_{\text {cis }}$ ).

| (trans |  |  |
| :---: | :---: | :---: |
| Comparison: |  |  |

M

Fig. 1 -Possible reactants for the synthesis of $\boldsymbol{M}$.
2. $\mathbf{M}$ can be synthesized in two steps from simple reactants (Fig. 1). Choose among the suggested reactants ( $\mathbf{N}$ to $\mathbf{Q}$ ) the ones that can provide $\mathbf{M}$ with very high regioselectivity. Sodium nitrite $\left(\mathrm{NaNO}_{2}\right)$ in cold aqueous hydrochloric acid is used as reagent for the first step of the synthesis.

Reactants: and

## Determination of the association constant $\boldsymbol{K}_{\mathrm{t}}$

$\beta$-cyclodextrin ( $\mathbf{C}$, Fig. 2) is a cyclic heptamer of glucose, which can form inclusion complexes with azo compounds. In parts 3 to 6 , we will determine by spectroscopy the association constant $K_{\mathrm{t}}$, corresponding to the formation of the inclusion complex $\mathrm{CM}_{\text {trans }}$ as depicted in Fig. 2.

Fig. 2 - Formation of the $\mathbf{C M}_{\text {trans }}$ inclusion complex.

Several solutions are prepared by mixing $\mathbf{C}$ and $\mathbf{M}_{\text {trans }}$ in different proportions to reach initial concentrations $[\mathbf{C}]_{0}$ and $\left[\mathbf{M}_{\text {trans }}\right]_{0}$. While $\left[\mathbf{M}_{\text {trans }}\right]_{0}$ is identical for all solutions, $[\mathbf{C}]_{0}$ varies. We follow, at a fixed wavelength, the difference $\Delta A$ between the absorbance of each solution and the pure $\mathbf{M}_{\text {trans }}$ solution. The molar absorption coefficients of $\mathbf{C} \mathbf{M}_{\text {trans }}$ and $\mathbf{M}_{\text {trans }}$, are $\varepsilon_{\mathrm{CMtrans}}$ and $\varepsilon_{\text {Mtrans }}$, respectively. $L$ is the path length of the beam through the sample. The absorbance of $\mathbf{C}\left(\varepsilon_{C}\right)$ is negligible.
3. Demonstrate that $\Delta A=\alpha \cdot\left[\mathbf{C M}_{\text {trans }}\right]$ and express $\alpha$ in terms of known constant( s$)$.

Demonstration:
$\alpha=$
4. Demonstrate that when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}$ (i.e. $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}$ ), the concentration of $\mathbf{C}$ may be considered as constant, i.e. $[\mathbf{C}] \simeq[\mathbf{C}]_{0}$.

Demonstration:
5. Demonstrate that when $\mathbf{C}$ is in large excess with respect to $\mathbf{M}_{\text {trans }}$ (i.e. $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {trans }}\right]_{0}$ ), $\Delta A=\alpha \cdot \frac{\beta \cdot[\mathrm{C}]_{0}}{1+K_{\mathrm{t}}[\mathrm{C}]_{0}}$ and express $\beta$ in terms of constant(s) and initial concentration(s).

Demonstration:

$$
\beta=
$$

6. Determine $K_{\mathrm{t}}$ using the following experimental curve (Fig. 3).

Fig. $3-$ Graph of $1 / \Delta A$ as a function of $1 /[C]_{0}$.
Calculations:
$K_{\mathrm{t}}=$

## Determination of the association constant $K_{c}$

In parts 7 to 9 , we will determine by kinetic studies the association constant $K_{\mathrm{c}}$, corresponding to the formation of the inclusion complex with $\mathbf{M}_{\text {cis, }}$, notated $\mathbf{C M} \mathbf{M i s}_{\text {cis }}$. A sample containing only $\mathbf{M}_{\text {trans }}$ is irradiated, thus producing a known amount of $\mathbf{M}_{\text {cis }}$, notated $\left[\mathbf{M}_{\text {cis }}\right]_{0}$. $\mathbf{M}_{\text {cis }}$ (free or within the inclusion complex) then thermally isomerizes into $\mathbf{M}_{\text {trans }}$. In the absence of $\mathbf{C}$, the isomerization follows a first order kinetics with a rate constant $k_{1}$. All complexation equilibria are faster than the isomerization processes. The kinetic scheme corresponding to this experiment is provided in Fig. 4.

Fig. 4 - Kinetic scheme for the isomerization of $\boldsymbol{M}_{\mathbf{c i s}}$ in the presence of $\boldsymbol{C}$.
The rate of disappearance $r$ for the total amount of $\mathbf{M}_{\text {cis }}$ (free and complexed) is defined as

$$
r=k_{1}\left[\mathbf{M}_{\text {cis }}\right]+k_{2}\left[\mathbf{C M}_{\text {cis }}\right]
$$

Experimentally, $r$ follows an apparent first order kinetic law with an apparent rate constant $k_{\text {obs: }}$

$$
r=k_{\mathrm{obs}}\left(\left[\mathbf{M}_{\mathrm{cis}}\right]+\left[\mathbf{C M}_{\mathrm{isi}}\right]\right)
$$

7. Demonstrate that $k_{\mathrm{obs}}=\frac{\gamma+\delta \cdot k_{2}[\mathrm{C}]}{1+K_{\mathrm{c}}[\mathrm{C}]}$ and express $\gamma$ and $\delta$ in terms of known constant(s).

Demonstration:

$$
\gamma=\quad \text { and } \quad \delta=
$$

8. Choose in which condition(s) the half-life $t_{1 / 2}$ corresponding to $k_{\mathrm{obs}}$ can be expressed as $t_{1 / 2}=\frac{\ln 2}{\gamma}\left(1+K_{\mathrm{c}}[\mathbf{C}]_{0}\right)$ given that $[\mathbf{C}]_{0} \gg\left[\mathbf{M}_{\text {cis }}\right]_{0}$. Justify your answer, with relevant mathematical expressions.
$\square \quad$ Very slow isomerization of $\mathbf{M}_{\text {cis }}$ within cyclodextrin
$\square \quad$ Very slow isomerization of free $\mathbf{M c i s}$
$\square \quad \mathbf{C M}_{\text {cis }}$ very stable
$\square \quad$ CM ${ }_{\text {trans }}$ very stable

Demonstration:
9. Assuming the condition(s) in part 8 is/are satisfied, determine $K_{\mathrm{c}}$ by a linear regression using the data below. You may use a calculator or plot a graph.

| $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ | $[\mathbf{C}]_{0}\left(\mathrm{~mol} \mathrm{~L}^{-1}\right)$ | $t_{1 / 2}(\mathrm{~s})$ |
| :---: | :---: | :---: | :---: |
| 0 | 3.0 | $3.0 \cdot 10^{-3}$ | 5.9 |
| $1.0 \cdot 10^{-4}$ | 3.2 | $5.0 \cdot 10^{-3}$ | 7.7 |
| $5.0 \cdot 10^{-4}$ | 3.6 | $7.5 \cdot 10^{-3}$ | 9.9 |
| $1.0 \cdot 10^{-3}$ | 4.1 | $1.0 \cdot 10^{-2}$ | 12.6 |

Equation of the linear regression:

$$
K_{\mathrm{c}}=
$$

## Formation of nanomachines

Fig. 5 - Cleavage of an azobenzene-cyclodextrin inclusion complex induced by a light-triggered isomerization, which allows delivery of a dye (grey circles).

Another azobenzene compound (for which $K_{\mathrm{c}} \ll K_{\mathrm{t}}$ ), initially in the trans form, is covalently grafted onto silica (Fig. 5). The silica pores are filled with a dye (rhodamine B, grey circles in Fig. 5). Upon addition of $\mathbf{C}$, an inclusion complex is formed, which blocks the pores and prevents the release of the dye.
10. Choose the most appropriate condition (one choice only) so that the pores are initially blocked in the presence of $\mathbf{C}$, and the dye can be released upon irradiation.
$\square$

Problem 5 continues on next page $\rightarrow$

The azobenzene-silica powder loaded with a dye is placed in the corner of a cuvette (Fig. 6) so that the powder cannot move into solution. The powder is irradiated at a wavelength $\lambda_{1}$ to trigger the release of the dye from the pores (Fig. 5). To monitor this release by absorbance spectroscopy we measure the absorbance of the solution at wavelength $\lambda_{2}$.

Fig. 6 - Left: experimental setup used to monitor the release of the dye; right: absorption spectra of trans-azobenzene (full line), cis-azobenzene (dotted line) and rhodamine B (dashed line).

## 11. Determine $\lambda_{1}$.

$\square$
12. Determine $\lambda_{2}$.
$\lambda_{2}=\mathrm{nm}$

## Problem T6: Characterization of a block-copolymer

Block-copolymers, obtained by linking different polymers (blocks), have unique properties, such as the ability to self-assemble. In this problem, the synthesis and characterization of such a macromolecule are studied.

## Study of the first block

In this first part, we will study the water soluble homopolymer $\mathbf{1}$ ( $\alpha$-methoxy- $\omega$ aminopolyethyleneglycol).
The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}\left(\mathrm{DMSO}-d_{6}, 60^{\circ} \mathrm{C}, 500 \mathrm{MHz}\right)$ includes the following signals:

| Index | $\boldsymbol{\delta}(\mathbf{p p m})$ | Peak Area |
| :---: | :---: | :---: |
| a | $2.7^{*}$ | 0.6 |
| b | 3.3 | 0.9 |
| c | 3.4 | 0.6 |
| d | $\sim 3.5$ | 133.7 |

Table 1, *in the presence of $\mathrm{D}_{2} \mathrm{O}$, the signal at 2.7 ppm disappears.

1. Match the ${ }^{1} \mathrm{H}$ NMR signals $(a, b, c, d)$ from Table 1 with each of the corresponding protons.

2. Express the average degree of polymerization, $n$, as a function of the area $A_{\text {ос2 }}{ }^{2}$ of the NMR peak of the repeating unit, and the area $A_{\text {оснз }}$ of the NMR peak of the methyl end group. Calculate $n$.
$\square$

## Study of a diblock-copolymer

The synthesis of the second block of the copolymer is performed through the reaction of $\mathbf{1}$ with $\mathbf{2}$ ( $\varepsilon$-(benzyloxycarbonyl)-lysine $N$-carboxyanhydride). This yields the block-copolymer 3 .

3. Draw the reaction intermediate that is formed in the first step of the addition of $\mathbf{1}$ to $\mathbf{2}$. The second step of the mechanism leads to the formation of a gas molecule, G. Draw its structure.

G:
4. Infrared (IR) measurements are performed to characterize the compounds. Match the three IR spectra with compounds $\mathbf{1 , 2}$ and $\mathbf{3}$.

5. The ${ }^{1} \mathrm{H}$ NMR spectrum of copolymer 3 (in DMSO- $d_{6}$, at $60^{\circ} \mathrm{C}, 500 \mathrm{MHz}$ ) is reported in Fig. 1 . Using some or all of the NMR signals, the areas of which are reported in Table 2, calculate its number average molar mass $M_{\mathrm{n}}$, considering $n$ from question 2 . For your calculations, draw a circle around the group(s) of atoms you used and give their corresponding symbol(s) ( $\alpha, \beta \ldots$ ).

Table 2

| Peak | Area |
| :---: | :---: |
| $\alpha$ | 22.4 |
| $\beta$ | 119 |
| $\gamma$ | 23.8 |
| $\delta$ | 47.6 |
| $\varepsilon$ | 622 |

Fig. 1 - signals marked with * correspond to the solvent and water.

$M_{\mathrm{n}}=$
$\mathrm{kg} \mathrm{mol}^{-1}$
Provide your answer with two decimal places.

This reaction of $\mathbf{1}$ with $\mathbf{2}$ yielded the copolymers $\mathbf{3 a}$ after $20 \mathrm{~h}, \mathbf{3 b}$ after 25 h , and $\mathbf{3 c}$ after 30 h of reaction at $40^{\circ} \mathrm{C}$. Results of size-exclusion chromatography (SEC) experiments are given in Fig. 2.

Fig. 2 - SEC chromatograms of $3 \boldsymbol{a}, 3 \boldsymbol{b}$ and $3 \boldsymbol{c}$ as a function of the elution volume, $V_{e}$.
6. Match the signals in Fig. 2 with the copolymers 3a, 3b and $\mathbf{3 c}$.

| 3a: | $\square X$ | $\square Y$ | $\square Z$ |
| :--- | :--- | :--- | :--- |
| 3b: | $\square X$ | $\square Y$ | $\square Z$ |
| 3c: | $\square X$ | $\square Y$ | $\square Z$ |

In order to calibrate the chromatogram, a mixture of standard polymers of known masses $(3,30,130$, 700 and $7000 \mathrm{~kg} \mathrm{~mol}^{-1}$ ) was studied (Fig. 3).
The $\log$ value of the molar mass is a linear function of the elution volume, $V_{\mathrm{e}}$.

Fig. 3 - SEC chromatogram of the mixture of standards.
7. Based on the SEC curves in Fig. 2 and 3, determine elution volume, $V_{\mathrm{e}}$, of the polymer that corresponds to curve $X$ and use it to estimate the degree of polymerization $m$ of its second block. Show your calculations; you may use a calculator or plot a graph.

## Triblock-copolymer synthesis

For biological applications involving the formation of micelles, a triblock-copolymer 9 can be synthesized through the introduction of a middle block, $\mathbf{B}$, using monomer 5.

8. Draw the structures of 5, $\mathbf{7}$ and $\mathbf{8}$.

5 (no other products than 6:A-B are obtained)

7 (a gas is formed in the final step)

8
9. Amphiphilic block-copolymers, such as 9: A-B-C, can be used for medical applications, as they self-assemble into micelles in water $(\mathrm{pH}=7)$, which can be used as drug carriers. Assign each block of the copolymer to a property. Draw a diagram of a micelle with only 4 polymer chains.

## Problem T7: Ring motion in a [2]catenane

| Problem <br> T7 <br> $\mathbf{6 \%}$ | Question | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ | $\mathbf{1 1}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Points | 4 | 12 | 2 | 2 | 2 | 5 | 5 | 8 | 4 | 5 | 5 | 54 |
|  | Score |  |  |  |  |  |  |  |  |  |  |  |  |

In 2016, the Nobel Prize in Chemistry was awarded to J.-P. Sauvage, Sir J. F. Stoddart and B. L. Feringa "for the design and synthesis of molecular machines". An example of these is [2]catenane, a molecule consisting of two interlocked rings. In this system, one macrocycle contains a single phenanthroline (bidentate) ligand and the second contains two ligands: a phenanthroline and a terpyridine (tridentate) ligand. A copper ion is coordinated by one ligand from each macrocycle. Depending on the oxidation state of the copper ( +I or +II ), two configurations are obtained (Fig. 1).

Fig. 1-Multi-stability of a ring in a [2]catenane.
The synthesis of the macrocycle is as follows:

1. Draw the structure of $\mathbf{B}$.

B
2. Draw the structures of $\mathbf{E}, \mathbf{F}$ and $\mathbf{G}$.
E
3. Out of the following reaction conditions, choose which one(s) can produce $\mathbf{E}$ from $\mathbf{D}$ :
$\square \mathrm{H}^{+}, \mathrm{H}_{2} \mathrm{O}$
$\square \mathrm{OH}^{-}, \mathrm{H}_{2} \mathrm{O}$
$\square \mathrm{NaBH}_{4}, \mathrm{CH}_{3} \mathrm{OH}$
$\square \mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{THF}$
4. In this synthetic strategy, MsCl is used to obtain:
$\square$ a leaving group
$\square$ a protecting group
$\square$ a deactivating groupa directing group
5. $\mathbf{G}$ is obtained by the reaction between $\mathbf{F}$ and LiBr in acetone. This reaction is:

```
\square ~ e l e c t r o p h i l i c ~ a r o m a t i c ~ s u b s t i t u t i o n ~
\square ~ n u c l e o p h i l i c ~ a r o m a t i c ~ s u b s t i t u t i o n
\square \mp@code { S N 1 }
\square SN2
```

6. Draw the transition state of the rate-determining step of the reaction $\mathbf{F} \rightarrow \mathbf{G}$, showing the 3D geometry. Depict only one reaction centre. The main carbon chain can be represented as an R group.

Transition state:

The synthesis of [2]catenane $\mathbf{L}$ utilises the template effect of a copper complex:

7. Write the full electronic configuration of $\mathrm{Cu}(0)$ in its ground state. Give the oxidation state of Cu in complex $\mathbf{J}$ and write the electronic configuration of $\mathbf{C u}$ in the free ion corresponding to $\mathbf{J}$.

Electronic configuration of $\mathrm{Cu}(0)$ :

Oxidation state of Cu in $\mathbf{J}$ :

Electronic configuration of $\mathbf{C u}$ in $\mathbf{J}$ :
8. Select the geometry of the copper ion in $\mathbf{L}$. Assuming an ideal geometry of the ligands around the copper center, draw the crystal field splitting diagram for the d-orbitals. Fill the orbital diagram. Give the maximum value of the spin ( $S$ ) for this complex.

The geometry of Cu in $\mathbf{L}$ is:
$\square$ Octahedral
$\square$ Tetrahedral
$\square$ Square planar
$\square$ Trigonal bipyramid
Crystal field splitting diagram:
$S=$
9. Out of the following compounds, choose the one(s) that can remove the copper ion in $\mathbf{L}$ to obtain the free [2]catenane:

| $\square \mathrm{CH}_{3} \mathrm{CN}$ | NH2 |
| :---: | :---: |
| $\square \mathrm{NH}_{4} \mathrm{PF}_{6}$ |  |
| KCN | $\mathrm{H}_{2} \mathrm{\sim}$ |
| $\square$ tren | tren |

In the [2]catenane, $\mathbf{L}$, the copper ion can exist in two oxidation states (+I) or (+II), and each exhibits a different coordination sphere (tetra- or penta-coordinated, respectively).

Fig. 2 -[2]catenane $\boldsymbol{L}$ states

The stability of $\mathrm{Cu}(\mathrm{I})$ complexes can be inferred by comparing their electronic structures to that of a noble gas.
10. Fill in the blanks with a number or a tick:

The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex has $\ldots$ electrons in the coordination sphere of the metal.

The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{5}$ complex has $\ldots$ electrons in the coordination sphere of the metal.

The $\mathrm{Cu}^{\mathrm{I}} \mathrm{N}_{4}$ complex is $\square$ more / $\square$ less stable than the $\mathrm{Cu}^{\mathrm{l}} \mathrm{N}_{5}$ complex.
11. Fill in the solid boxes with the labels of the involved complexes in Fig. 2 and complete the sequence to depict how electrochemical control of the system would be achieved. Use the following notation for the dashed boxes: $\square$ (rotation); $+\mathrm{e}^{-} ;-\mathrm{e}^{-}$.

| Problem <br> T8 <br> $\mathbf{6 \%}$ | Question | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ | $\mathbf{1 1}$ | $\mathbf{1 2}$ | $\mathbf{1 3}$ | $\mathbf{1 4}$ | $\mathbf{1 5}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Points | 2 | 6 | 2 | 2 | 11 | 2 | 4 | 3 | 4 | 2 | 6 | 8 | 2 | 6 | 4 | 64 |
|  | Score |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Problem T8: Identification and synthesis of inositols

In this problem, we define " 3 D structure" and "perspective formula" as indicated for $\beta$-glucose in the following figure.

3D structure

perspective formula

Inositols are cyclohexane-1,2,3,4,5,6-hexols. Some of these 6-membered carbocycles are involved in a number of biological processes, myo-inositol in particular.

## Structure of myo-inositol

1. Draw the structural formula of inositols, without stereochemical details.
$\square$

This family of molecules contains 9 different stereoisomers, including enantiomers.
2. Draw all 3D structures of the stereoisomers that are optically active.

The structure of a specific inositol, called myo-inositol, is studied here. Only one of its chair conformers is predominant and its structure can be deduced from its ${ }^{1} \mathrm{H}$ NMR spectrum. The spectrum below was obtained at 600 MHz in $\mathrm{D}_{2} \mathrm{O}$. No other signal from that compound was observed in the spectrum. The integration is indicated on the spectrum below each signal.

3. Give the molecular formula of the predominant compound derived from myo-inositol in this sample that is consistent with the number of protons observed in the ${ }^{1} \mathrm{H}$ NMR spectrum.
4. Based on the number and integrations of the proton signals, give the number of symmetry plane(s) that exist(s) in this molecule.
5. Complete the following perspective formula of the most stable conformation of myo-inositol. Label each hydrogen with the corresponding letter ( $\mathbf{a}, \mathbf{b}, \mathbf{c}$ or $\mathbf{d}$ ) according to the NMR spectrum above. Proton a must be on carbon a on the following representation. Draw its 3D structure.

## Synthesis of inositols

For medicinal applications, it is useful to synthesize some inositol phosphates on a large scale. We will study the synthesis of inositol 2 from bromodiol 1.

6. Choose the correct structural relationship(s) between $\mathbf{2}$ and $\mathbf{3}$.
$\square$ enantiomersepimersdiastereomersatropoisomers

Inositol $\mathbf{2}$ can be obtained from compound $\mathbf{1}$ in 7 steps.

7. Draw the 3D structure of $\mathbf{4}$.

4
8. The reaction leading to $\mathbf{5}$ occurs on the double bond with the highest electron density. Consider below the structure of 1-bromo-1,3-cyclohexadiene, which is a substructure of 4 . Circle the double bond with the highest electron density. On separate structures, represent all the electronic effects due to the bromine.

9. Draw the 3D structure of the major diastereomer 5 .

5
10. Give the total number of stereoisomers of $\mathbf{5}$ possibly obtained by the synthesis starting from enantiopure compound 1.
11. For the step $\mathbf{5} \rightarrow \mathbf{6}$, another product with the same molecular formula, denoted $\mathbf{6}$, can be produced. Draw the 3D structures of $\mathbf{6}$ and $\mathbf{6}$ '.

| 6 | 6 |  |
| :--- | :--- | :--- |
|  |  |  |

12. Draw the 3D structures of major diastereomers $\mathbf{8}$ and $\mathbf{9}$.

| $\mathbf{8}$ | $\mathbf{9}$ |  |
| :--- | :--- | :--- |
|  |  |  |
|  |  |  |
|  |  |  |

13. Select the correct set(s) of conditions A to obtain 2.
$\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$
$\square \mathrm{K}_{2} \mathrm{CO}_{3}$, HF
$\square \mathrm{HCOOH}, \mathrm{H}_{2} \mathrm{O}$$\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$
14. If the bromine is not present in compound $\mathbf{1}$, then another stereoisomer would be obtained in addition to 2 . Given that the stereoselectivity of the reactions that take place in the synthesis remains unchanged, and that all the steps involve the same number of equivalents as for $\mathbf{2}$, draw the 3D structure of this stereoisomer and give its relationship with 2.
$\square$
15. Choose the steps that correspond to the removal of protecting or directing groups during the synthesis of $\mathbf{2}$ from 1.
```
\(\square \quad 1 \rightarrow 4\)
\(\square \quad 4 \rightarrow 5\)
\(\square 5 \rightarrow 6\)
\(\square 6 \rightarrow 7\)
\(\square 7 \rightarrow 8\)
\(\square 8 \rightarrow 9\)
\(\square \mathbf{9} \rightarrow 2\)
```

## Problem T9: Synthesis of levobupivacaine

## Part I.

The local anaesthetic bupivacaine (marketed as Marcaine) is on the World Health Organization’s List of Essential Medicines. Although the drug is currently used as a racemic mixture, it has been demonstrated that one enantiomer of bupivacaine, levobupivacaine, is less cardiotoxic and therefore safer than the racemate. Levobupivacaine can be synthesized from the natural amino acid L-lysine.

L-Lysine hydrochloride

1. Assign the absolute configuration of the chiral centre in L-lysine hydrochloride and justify your answer by labelling the substituents in order of their priority.

2. The prefix L in L-lysine refers to relative configuration. Choose all correct statements:
$\square$ All natural L-amino acids are levorotatory.
$\square$ Natural L-amino acids can be levorotatory or dextrorotatory.
$\square$ All natural L-amino acids are ( $S$ ).
$\square$ All natural L-amino acids are $(R)$.

Often, we want only one of the amino groups in L-lysine to react. $\mathrm{ACu}^{2+}$ salt with excess aqueous hydroxide can selectively mask the reactivity of one of the amino groups. After the complex is formed, only the non-complexed $\mathrm{NH}_{2}$ group is available to react.
3. Considering that L -lysine acts as a bidentate ligand and that two molecules of L -lysine coordinate to one $\mathrm{Cu}^{2+}$ ion in the presence of aqueous hydroxide, draw the structure of the intermediate complex.

Complex:

Fortunately, in the synthesis of levobupivacaine shown below, the same amino group reacts even without using the $\mathrm{Cu}^{2+}$ salt.

 reactive intermediate

From this point on, you can use the abbreviations proposed in the scheme above.
4. Draw the structure of compound $\mathbf{A}$, including the appropriate stereochemistry.

A
5. Transformation of L-lysine into $\mathbf{A}$ is (choose the correct answer(s)):
$\square$ an enantioselective reaction.an enantiospecific reaction.
$\square$ a regioselective reaction.
6. Draw the structures of compounds $\mathbf{B}-\mathbf{F}$, including the appropriate stereochemistry.

| B $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}$ | C C $_{16} \mathrm{H}_{21} \mathrm{NO}_{6}$ |
| :--- | :--- |
|  |  |
| D C |  |

7. What is the role of DCC in the transformation $\mathbf{C} \rightarrow \mathbf{D}$ ?Protecting group for the amino group.Protecting group for the hydroxy group.Activating agent for the amide bond formation.
8. TsCl is used in the synthesis to enable:
$\square$ Nucleophilic substitution of an amino group.
$\square$ Electrophilic substitution of an amino group.Nucleophilic substitution of a hydroxy group.Electrophilic substitution of a hydroxy group.
9. Mark all possible reagents which could be used as reagent $\mathbf{H}$ :

| $\square$ diluted HCl | $\square \mathrm{Zn} / \mathrm{HCl}$ |
| :--- | :--- |
| $\square \mathrm{K}_{2} \mathrm{CO}_{3}$ | $\square \mathrm{H}_{2} \mathrm{SO}_{4}$ |
| $\square$ diluted $^{\mathrm{KMnO}} 4$ | $\square$ diluted NaOH |
| $\square \mathrm{SOCl}_{2}$ | $\square \mathrm{PCl}_{5}$ |

10. Draw the structure of levobupivacaine, including the appropriate stereochemistry.

Levobupivacaine $\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}$

## $\xrightarrow{\text { Problem } 9 \text { continues on next page } \rightarrow}$

## Part II.

The synthesis of levobupivacaine requires the use of enantiomerically pure L-lysine. A common method to confirm the enantiomeric purity of amino acids is by their transformation into amides using Mosher's acid (see the structure of the ( $S$ ) isomer below).

11. Draw the structure of the amide formed when the $\alpha$-amino group of L-lysine is derivatized with (S)-Mosher's acid. Clearly show the stereochemistry of each chiral centre
12. How many products will be formed from racemic lysine and ( $S$ )-Mosher's acid, given that only the $\alpha$-amino group of lysine is derivatized?
$\square$ Two diastereomers.
$\square$ Four diastereomers.
$\square$ A racemic mixture of two enantiomers.
$\square$ Four compounds: two enantiomers and two diastereomers.
13. Choose the method(s) which can be used to quantitatively determine the enantiomeric purity of lysine after its derivatization with ( $S$ )-Mosher's acid:
$\square$ NMR spectroscopy.
$\square$ Liquid chromatography.
$\square$ Mass spectrometry.
$\square$ UV-vis spectroscopy.

## $\mathfrak{F}_{\text {ine }} \mathscr{A l} \mathfrak{D}_{\text {ente }}!$

(End of exam!)
